

# TOGAF artifacts

## Using ArchiMate diagrams

# BUSINESS ARCHITECTURE

## Motivations and constraints

**Aims**  
Goals  
Objectives  
Requirements

**Directives**  
Principles  
Policies  
Rules

**Compliance**  
Regulations  
Standards (SIB)  
Design Patterns (RM)

**Management**  
Time  
Budget  
Resources

## Passive structures

Things that are acted in or on

*Business service/Information Diagram*

## Behaviors

Things happening over time that access or change the state of business systems

*Process/Event/Control Cat.*

## Logical active structures

*Specifications*  
of things that act

*Node Connectivity Diagram  
Functional Decomposition  
Capability Map*

## Physical active structures

Things that act

*Node Connectivity Diagram  
Organisation Decomposition*

*Bus. Service Function Cat.*

*Org/Function Matrix*

*Business Scenario  
Process Flow*

*Role catalogue*

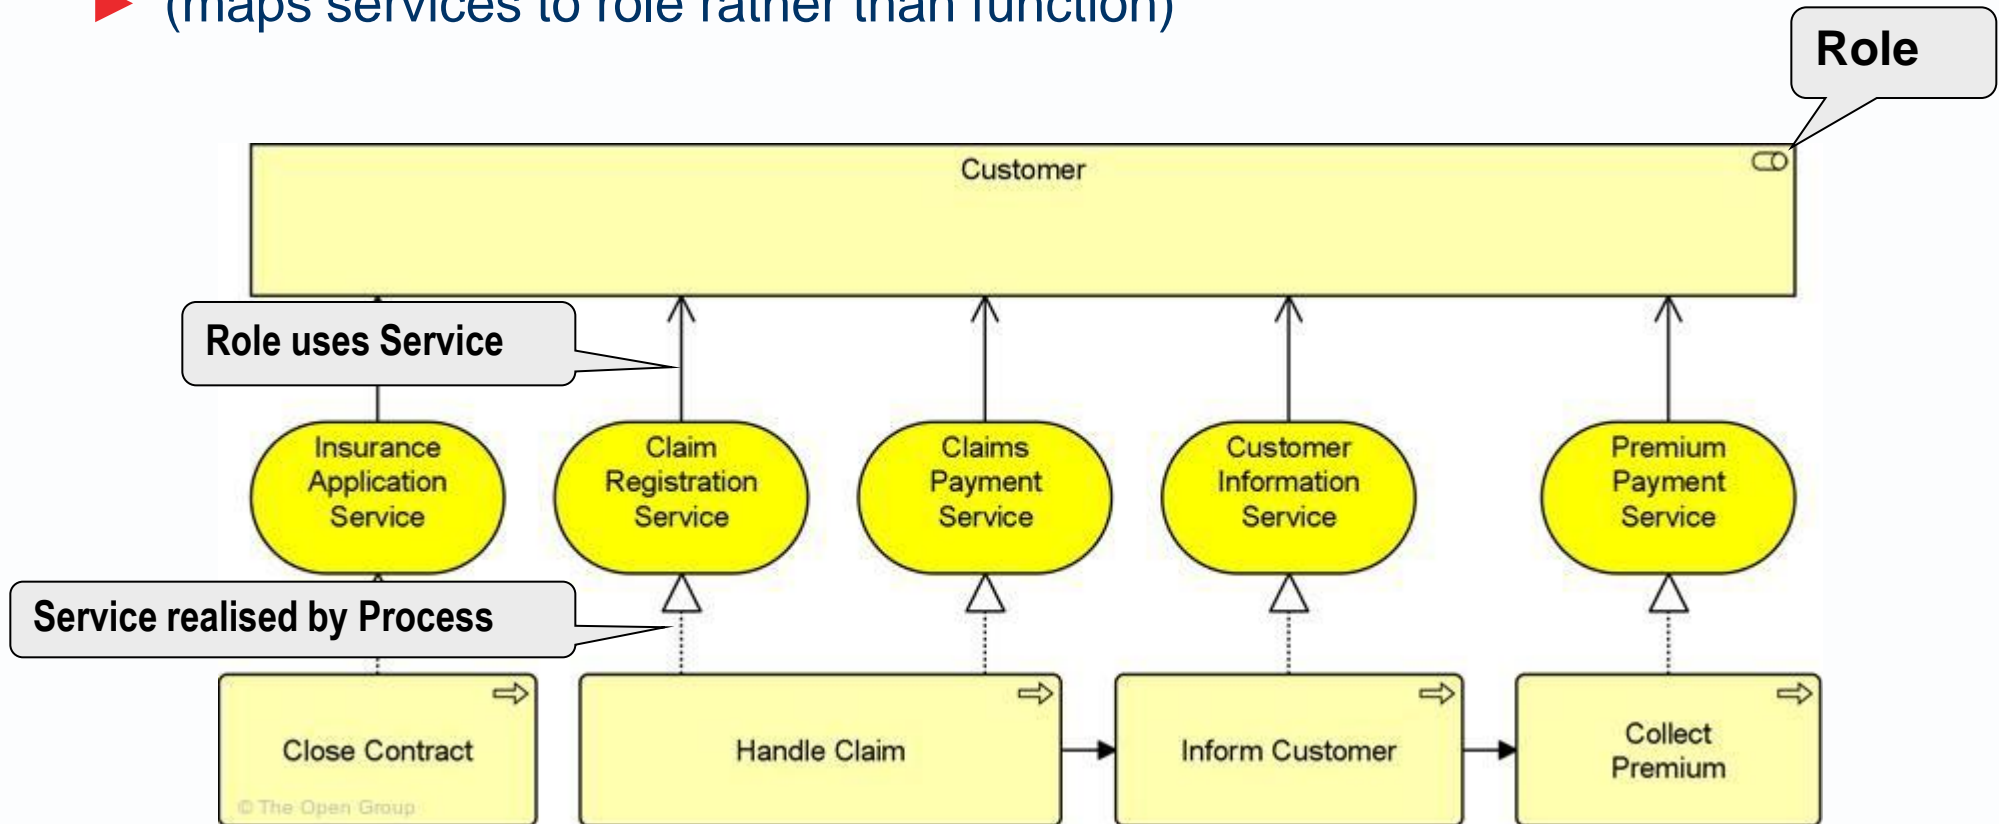

*Actor/Role Matrix*

*Org/Actor Catalogue*

- ▶ **Business Service/Function Catalog**
- ▶ ... to provide a functional decomposition in a form that can be filtered, reported on, and queried, as a supplement to Diagrams. It can be used to
  - identify capabilities of an organization
  - understand the level that governance is applied to the functions of an organization.
  - identify new capabilities required to support business change
  - determine the scope of change initiatives, applications, or technology components.

Function level 1	Function level 2	Business Service	Organisation Unit

- ▶ **A service realisation view**
- ▶ (maps services to role rather than function)

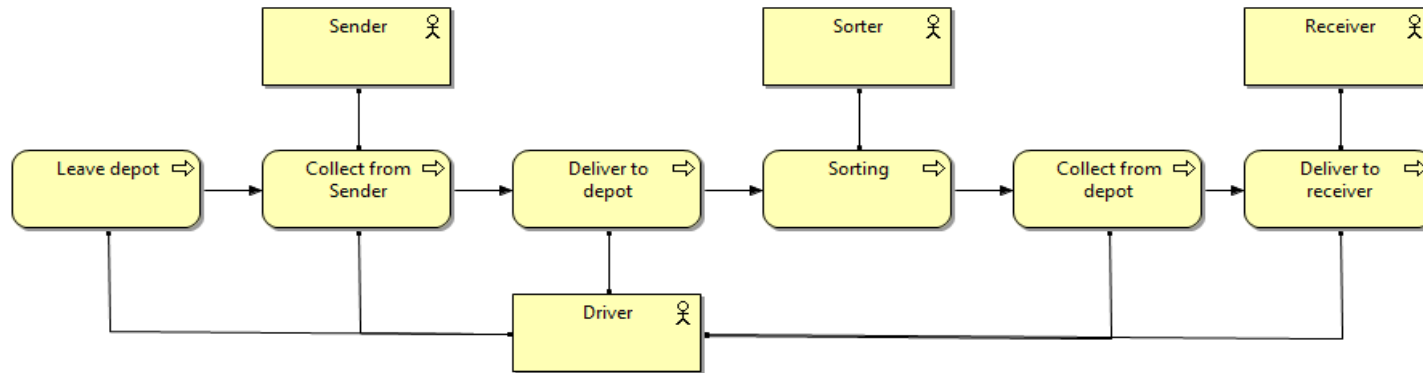

## TOGAF says: Business Scenario (cf. Value stream)

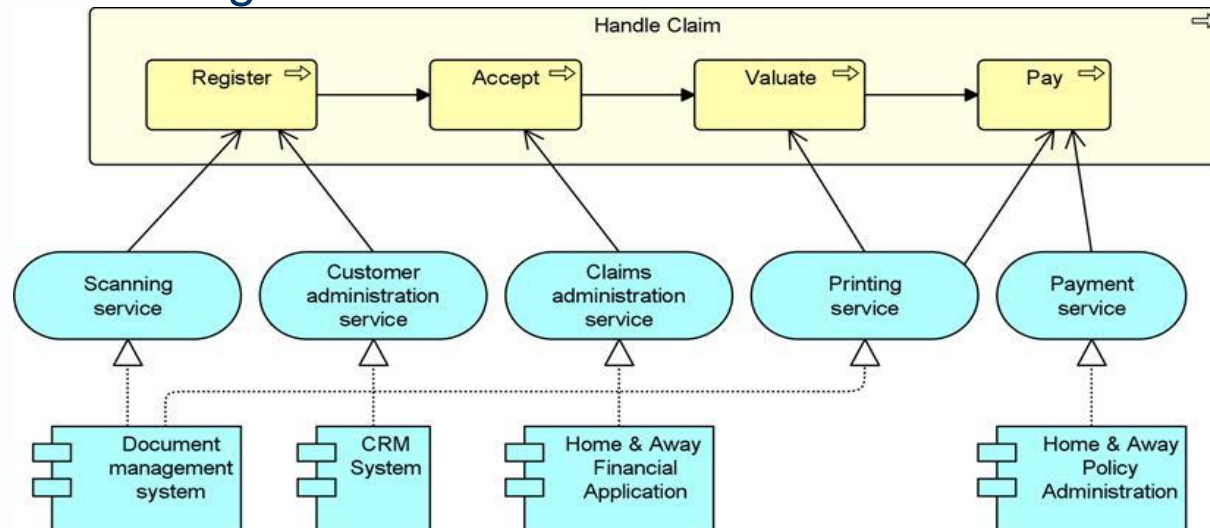

Documents the  
the **roles** of  
**human and computer actors** in a  
**process** that leads to a  
**business goal**

## Partial match in ArchiMate

Imagine combining this scenario drawn by Pieter Van Ostaeyen

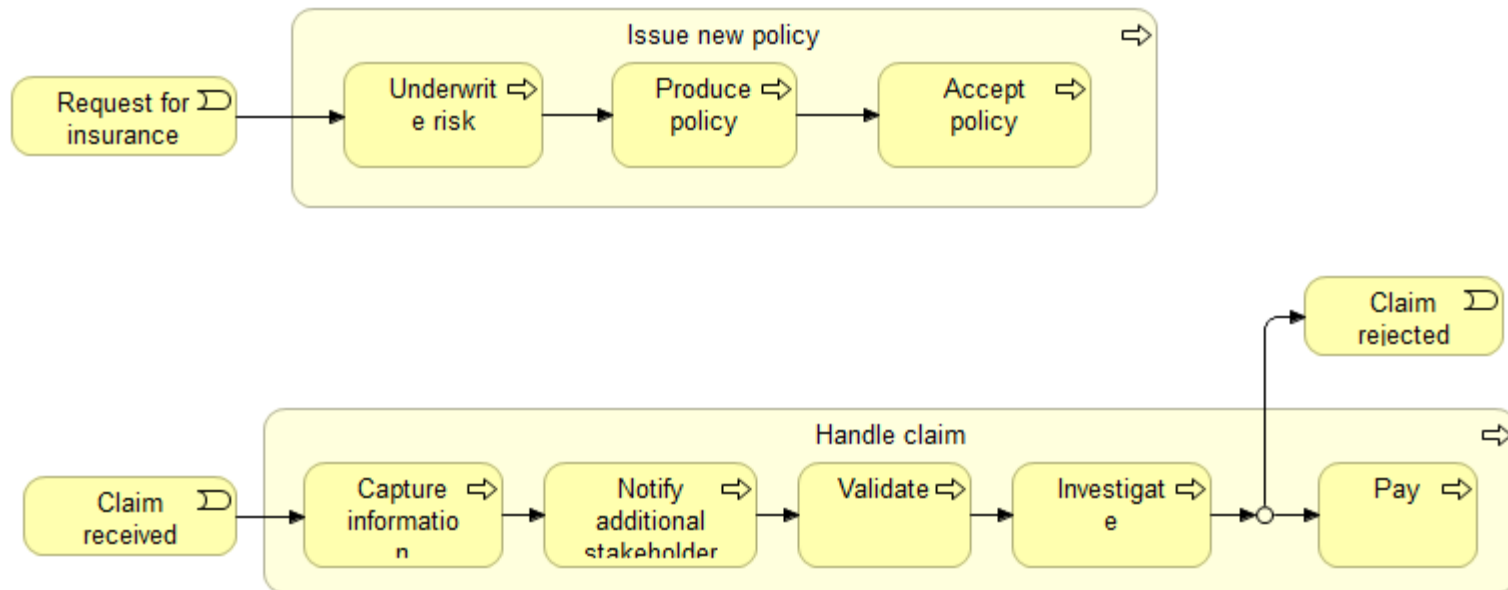

With this application usage view

- ▶ ... to depict all models and mappings related to the process metamodel entity.
- ▶ ... shows sequential flow of control between activities and may utilize swimlane techniques to represent ownership and realization of process steps.
- ▶ In addition to showing a sequence of activity, process flows can also be used to detail the controls that apply to a process, the events that trigger or result from completion of a process, and also the products that are generated from process execution.
- ▶ ... useful in elaborating the architecture with subject specialists, as they allow the specialist to describe “how the job is done” for a particular function. .

## ► Two process flow views

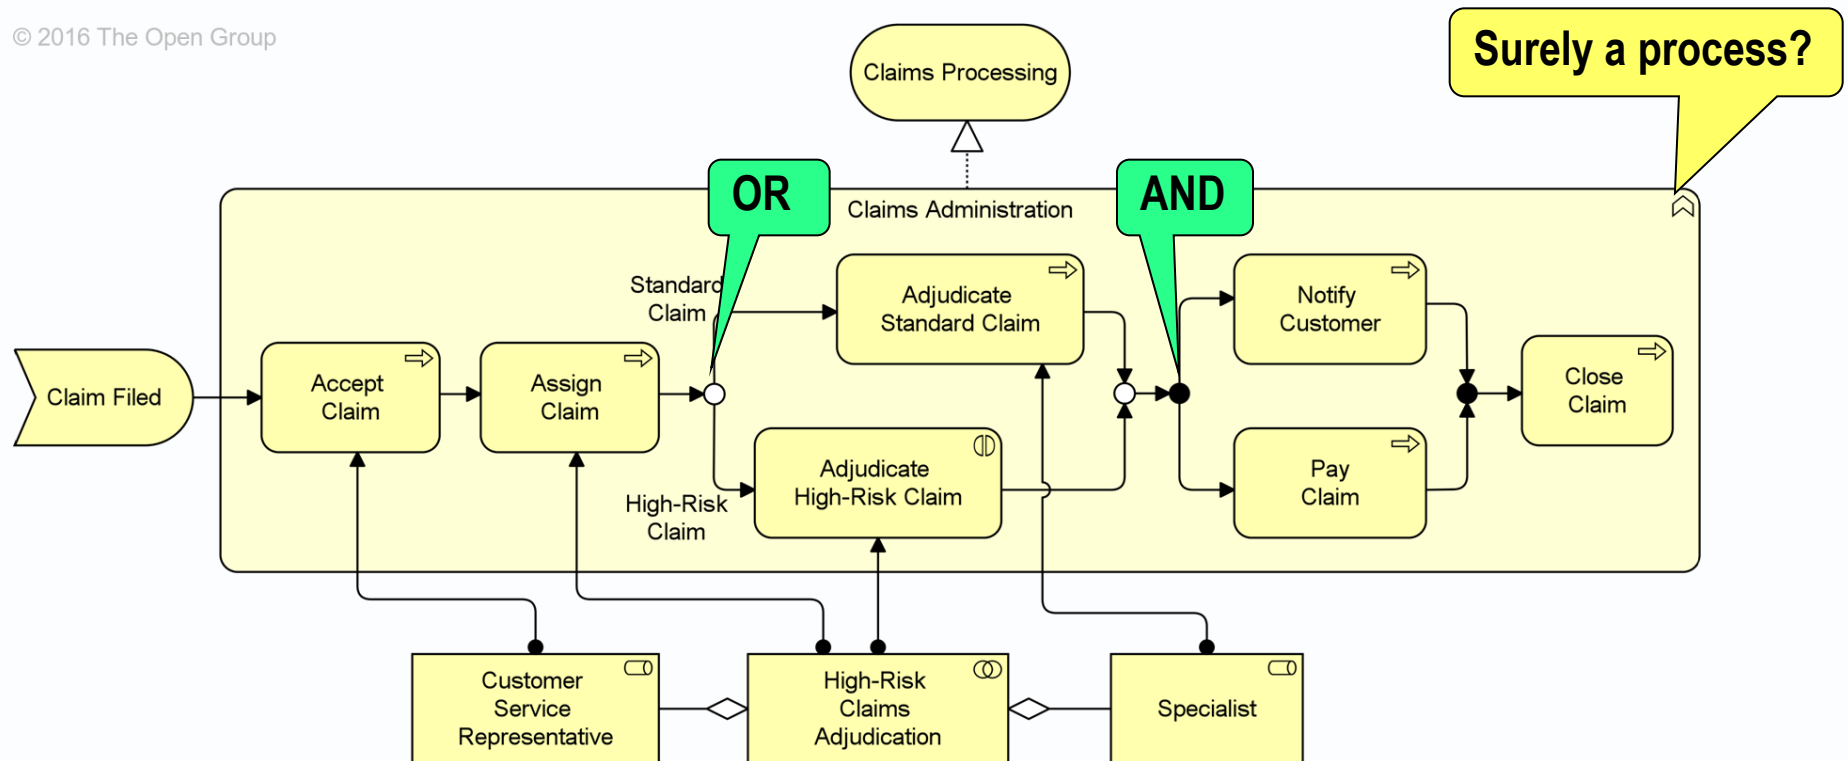

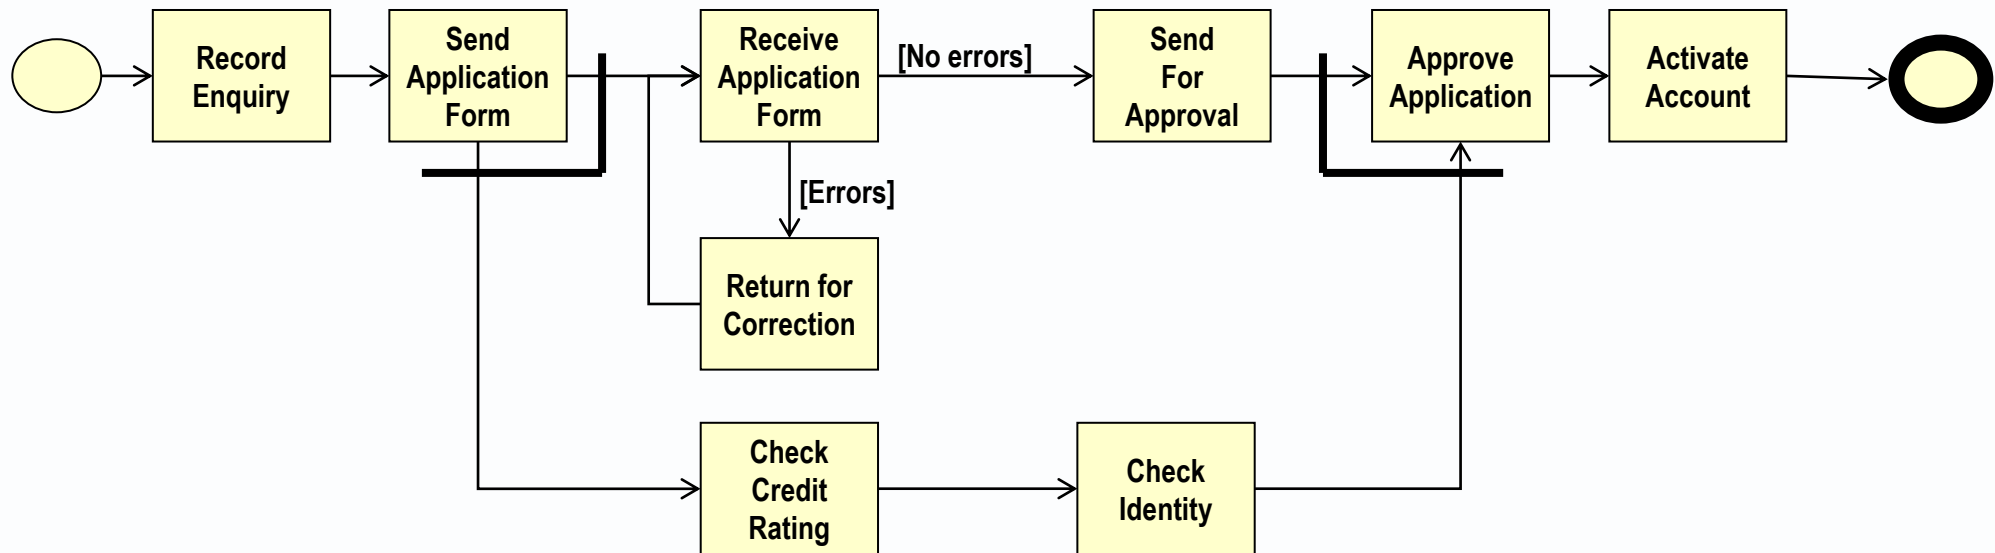

# Partial match in ArchiMate

- ▶ A process flow view
- ▶ (possible confusion of function with process)

© 2016 The Open Group

► The arrow means *transition* in UML, but *serves* in ArchiMate

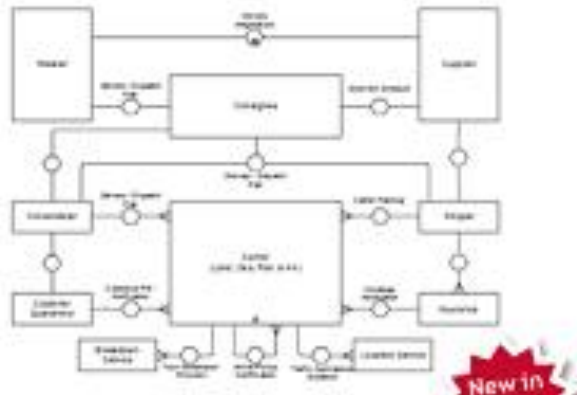

## BPMN offers 4 process model varieties

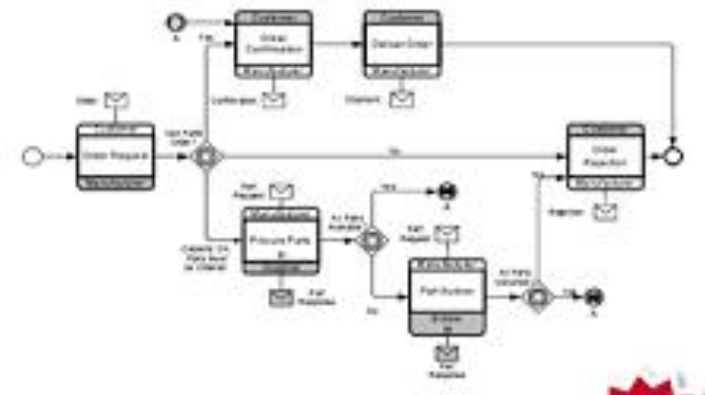

**Process model:** shows process elements under a logical control flow

**Collaboration model:** shows inter-process interactions

**Conversation model:** shows data exchanged between “processes” (also systems, functions, roles or actors)

**Choreography model:** focus on inter-actor interactions and message flows

# TOGAF says: Process/Event/Control/Product Catalog

- ▶ ... provides a hierarchy of processes, events that trigger processes, outputs from processes, and controls applied to the execution of processes.
- ▶ ... provides a supplement to any Process Flow Diagrams and allows an enterprise to filter, report, and query across organizations and processes to identify scope, commonality, or impact.
- ▶ For example, an enterprise can see relationships of processes to sub-processes in order to identify the full chain of impacts resulting from changing a high-level process.

Process	Process	Process	Input event	Output product	Control

# ArchiMate???

Avancier

# TOGAF says: Functional Decomposition Diagram

- ▶ ... to show on a single page the capabilities of an organization that are relevant to the consideration of an architecture.
- ▶ By examining the capabilities of an organization from a functional perspective, it is possible to quickly develop models of what the organization does without being dragged into extended debate on how the organization does it.
- ▶ Once a basic Diagram has been developed, it becomes possible to layer **heat-maps** on top of this Diagram to show scope and decisions. For example, the capabilities to be implemented in different phases of a change program.

# Good match in ArchiMate

A strict (non-redundant) hierarchy.

ArchiMate

## Support functions

Organisation

HR

Process

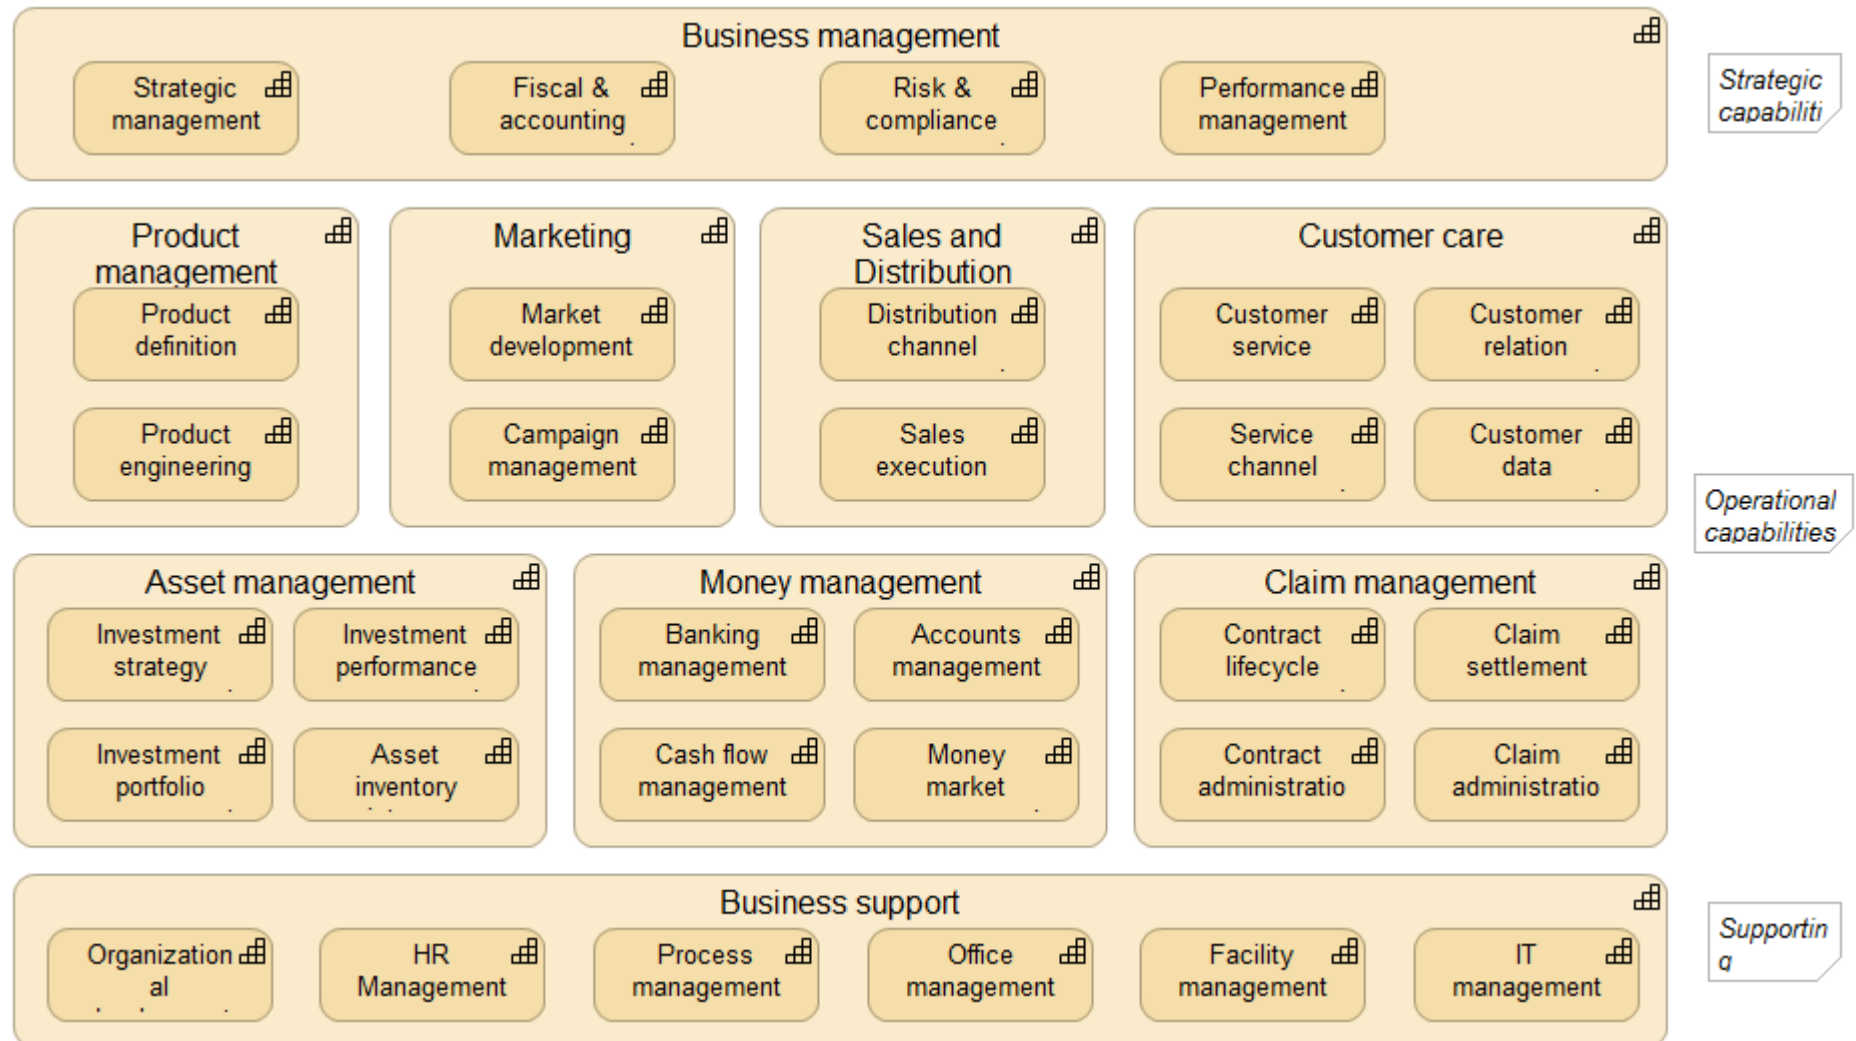

Office

Facility

ITSM

# More fashionable (aargh!) match in ArchiMate

## ► Capability map

# Note that Functions group activities in Processes

Swim lanes show logical structures

-  Actor
-  Role or
-  Function

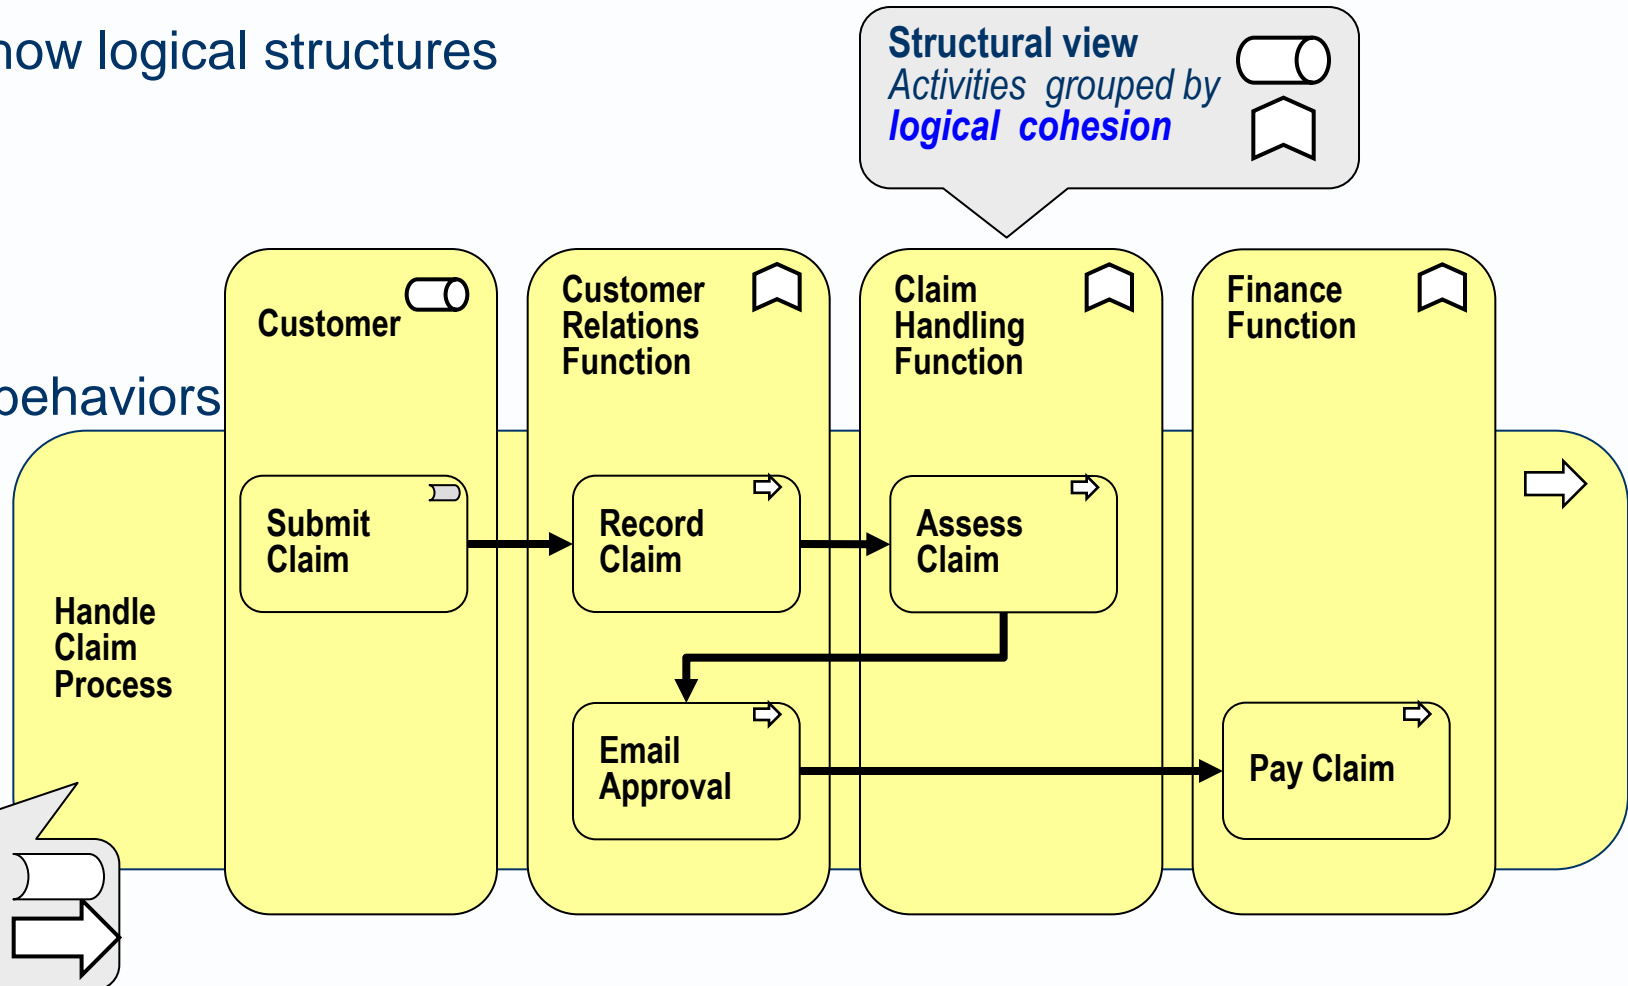

Arrows show behaviors

-  Event
-  Trigger
-  Activity

**Structural view**  
Activities grouped by  
**logical cohesion**

**Behavioural view**  
Activities in **sequence**

## TOGAF says: Structured Analysis:

- ▶ “Identifies the key business functions within the scope of the architecture, and maps those functions onto the organizational units within the business.”

Organisation Function	Marketing	Sales	Delivery
Marketing	Activity		
Sales		Activity	
Delivery			Activity

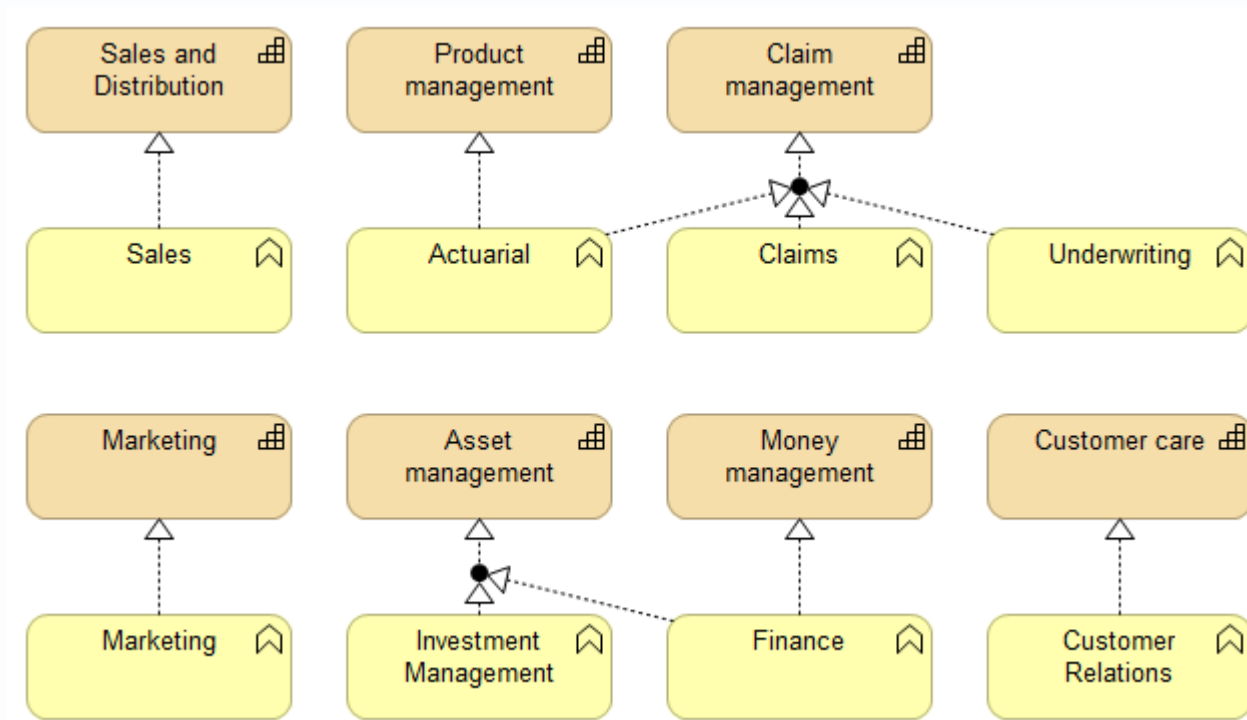

- ▶ Might reveal a
- ▶ “Functional organisation”

Organisation Function	Petrol	Paints	Plastics
Marketing	Activity	Activity	Activity
Sales	Activity	Activity	Activity
Delivery	Activity	Activity	Activity

- ▶ Or else a different (say
- ▶ product-oriented) organisation

## Weak match in ArchiMate

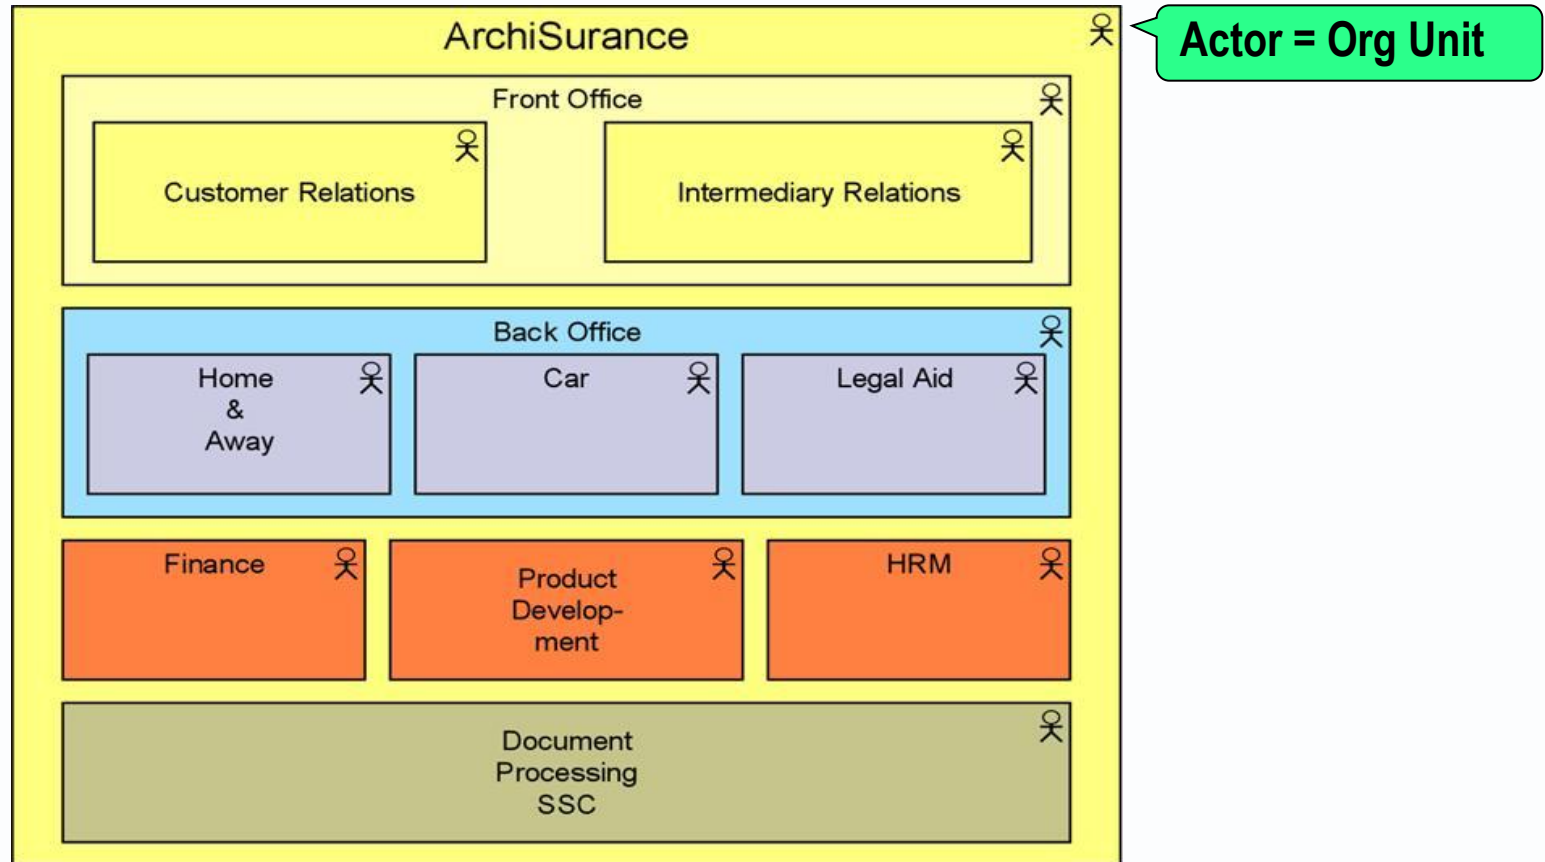

- ▶ A Capability realization view
- ▶ (In TOGAF organisation units realise functions/capabilities)

# TOGAF says: Organization Decomposition Diagram

- ▶ ... describes the links between actor, roles, and location within an organization tree.
- ▶ An organization map should provide a chain of command of owners and decision-makers in the organization.
- ▶ Although it is not the intent to link goal to organization, it should be possible to intuitively link the goals to the stakeholders from the diagram.

## ► An organisation view

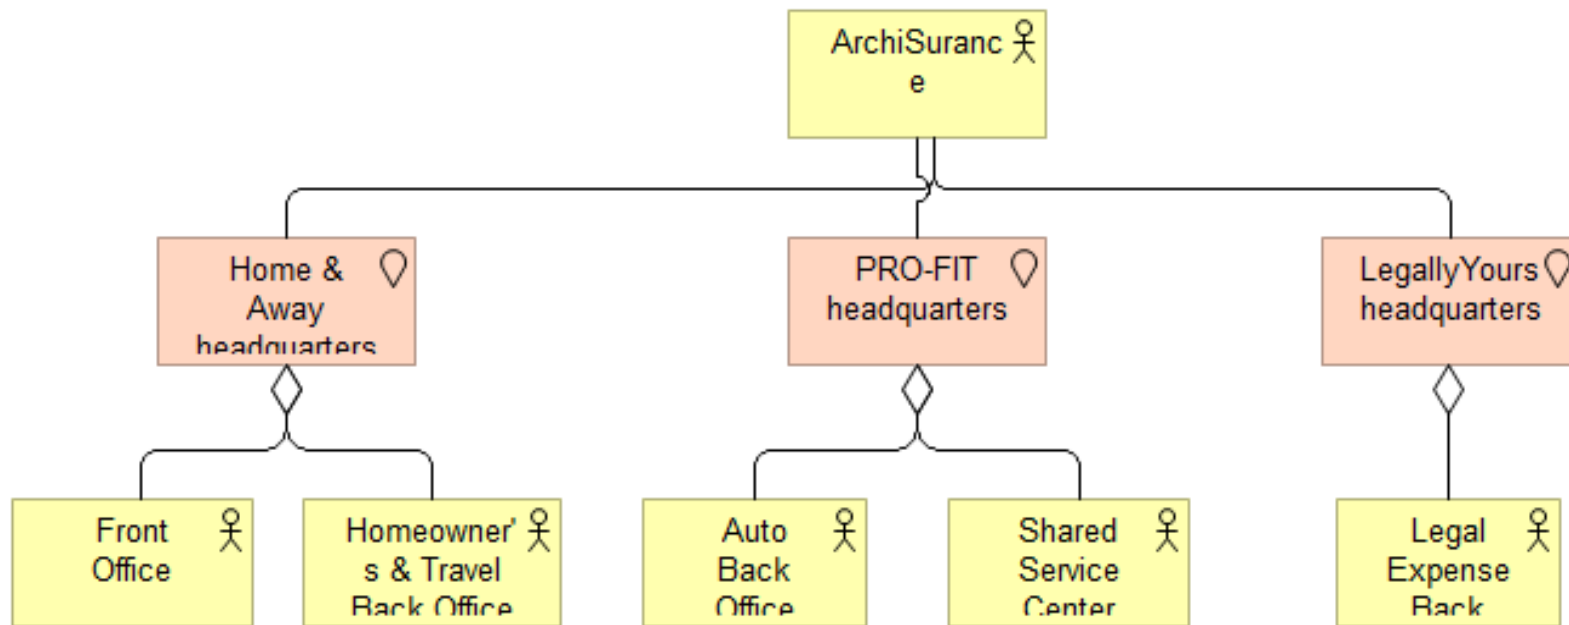

# TOGAF says: Organization/Actor Catalog

- ▶ ... to capture a definitive listing of all participants that interact with IT, including users and owners of IT systems.
- ▶ The catalog can be referenced when developing requirements in order to test for completeness.
- ▶ For example, requirements for an application that services customers can be tested for completeness by verifying exactly which customer types need to be supported and whether there are any particular requirements or restrictions for user types.

Org level 1	Org level 2	Org level 3	Location	Actor

- ▶ Though there may be some conflation of, or confusion between, organisation unit and location

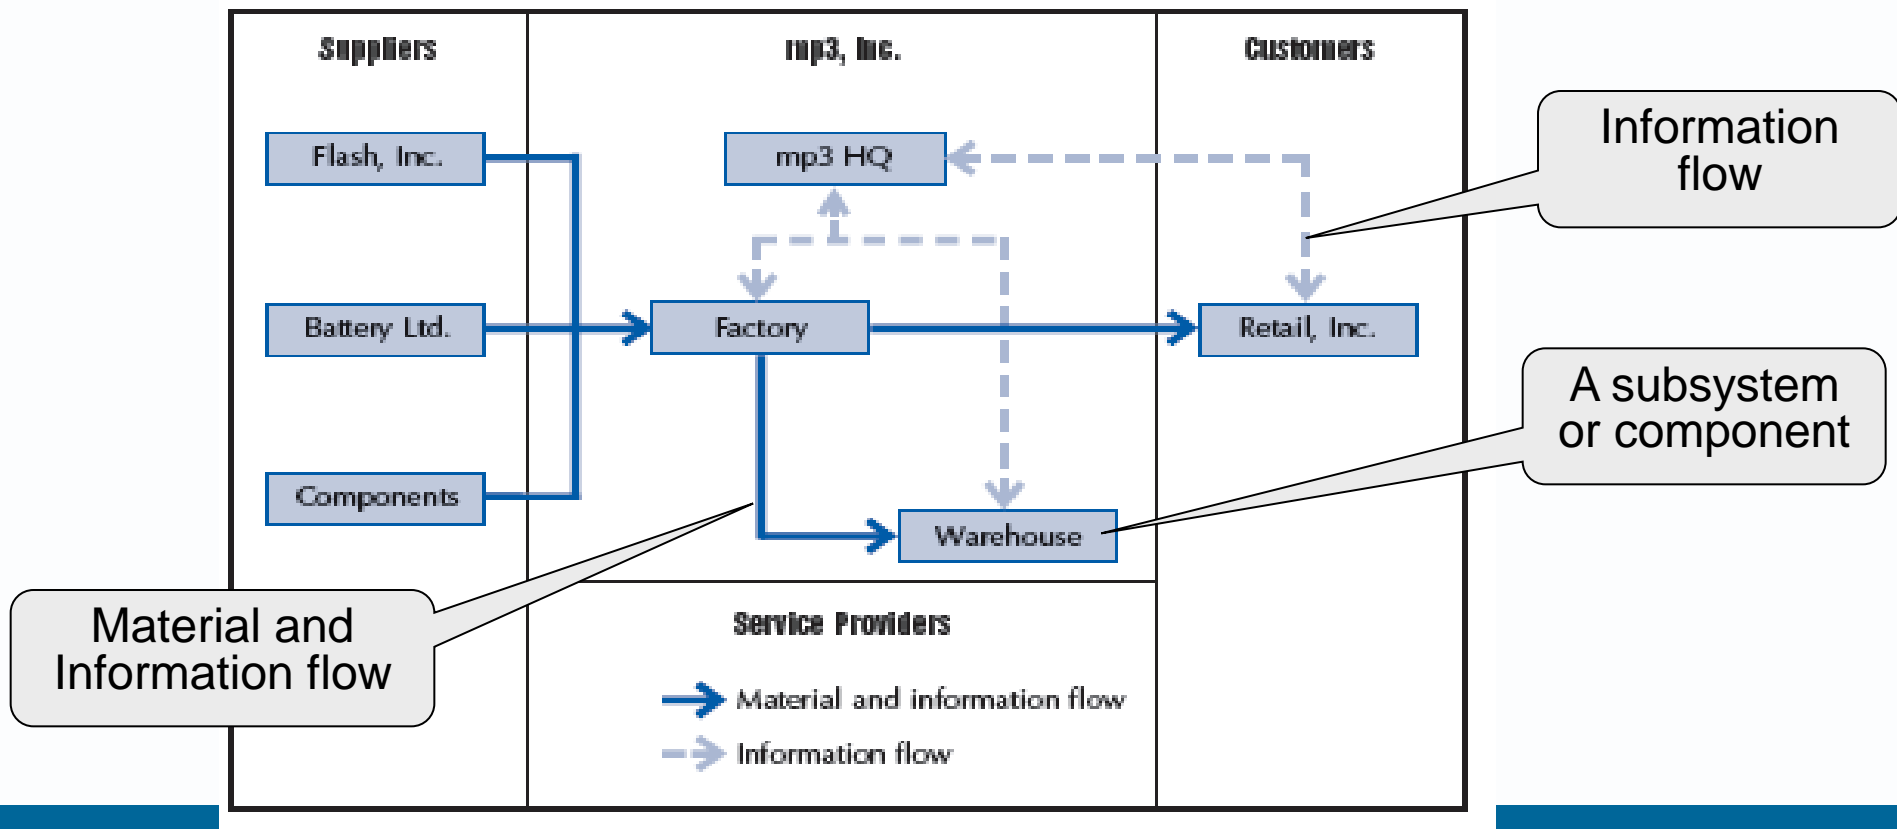

# TOGAF says: The Node Connectivity Diagram

- ▶ describes the business locations (nodes), the “needlines” between them, and the characteristics of the information exchanged.
- ▶ can be described at three levels: conceptual, logical, and physical.
- ▶ Each needline indicates the need for some kind of information transfer between the two connected nodes.
- ▶ A node can represent a role (e.g., a CIO), an organizational unit, a business location or facility, and so on.
- ▶ An arrow indicating the direction of information flow is annotated to describe the characteristics of the data or information — for example, its content, media, security or classification level, timeliness, and requirements for information system interoperability.

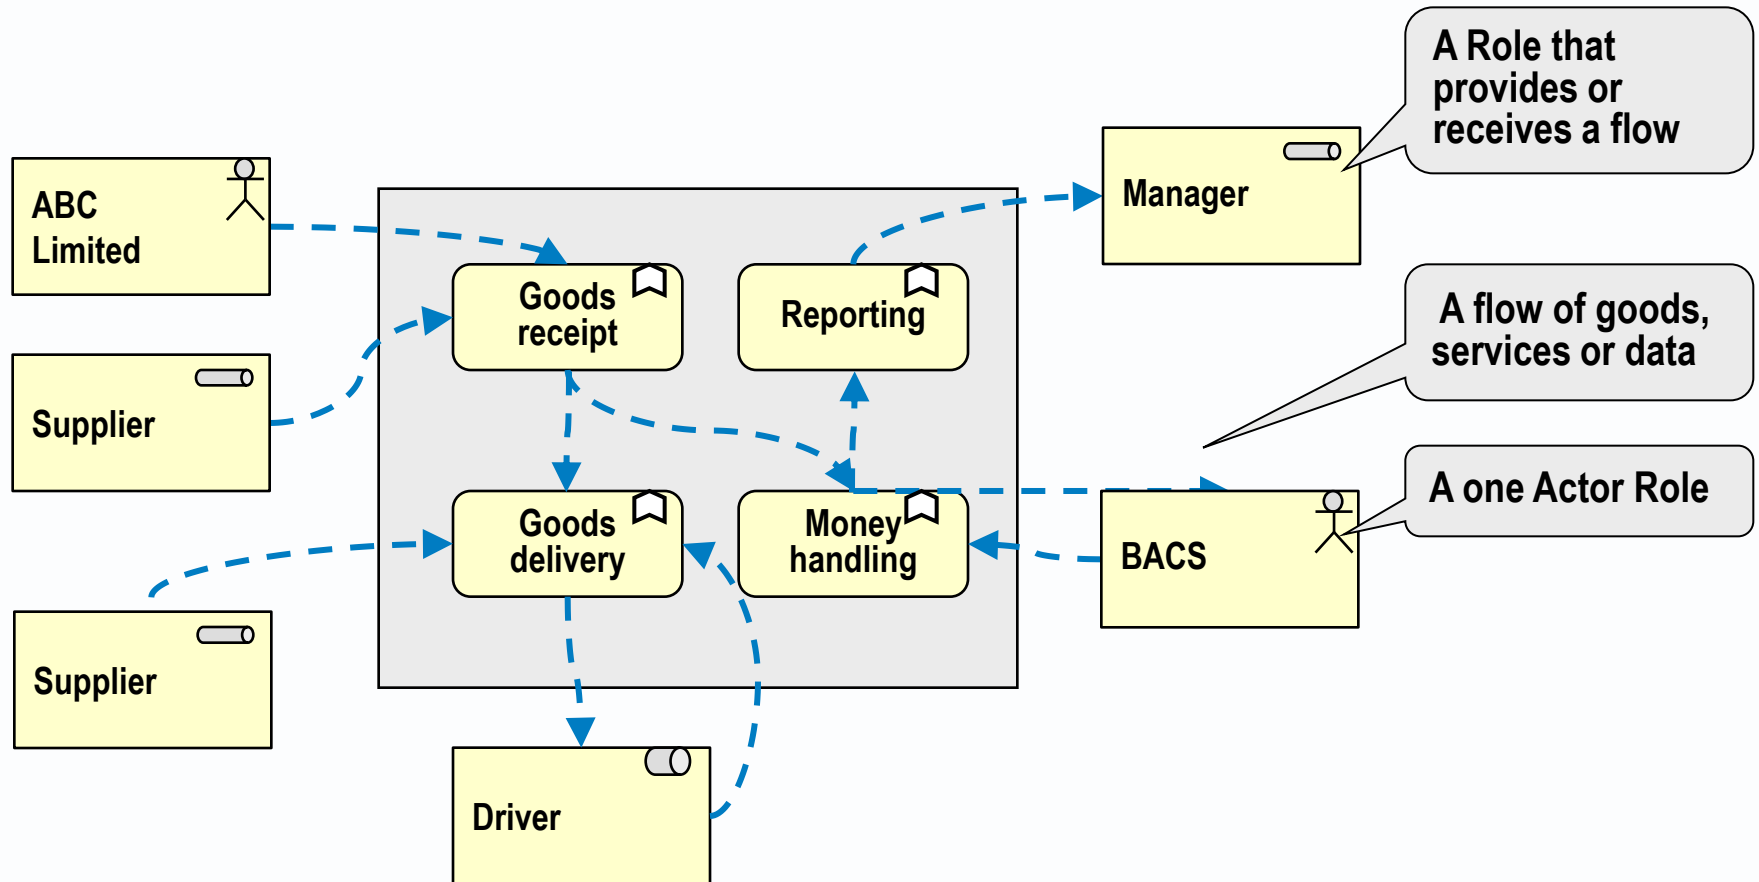

# Node connectivity Diagram: SCOR technique

1. Identify your customers
2. Identify your suppliers
3. Identify the key nodes (logical or physical entities in the supply chain)
4. Link nodes - differentiating material and information flows.

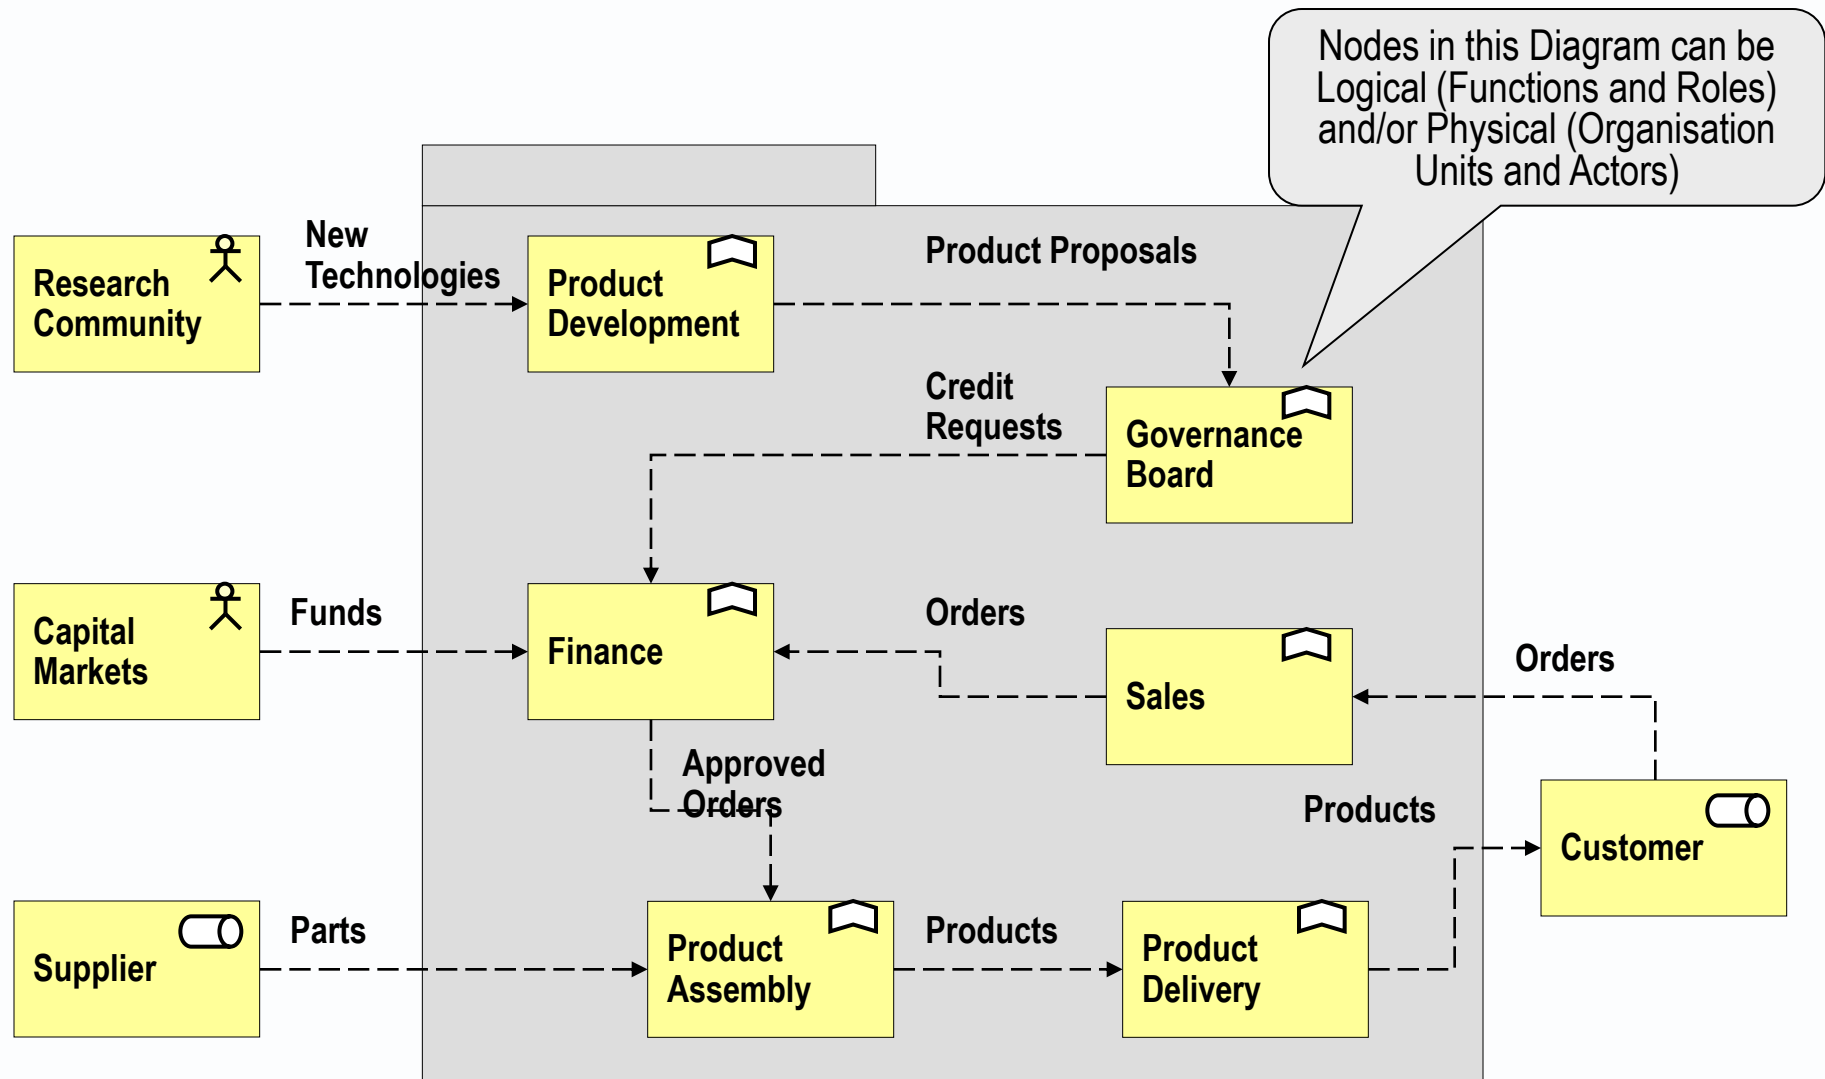

# Node Connectivity Diagram drawn using ArchiMate notation

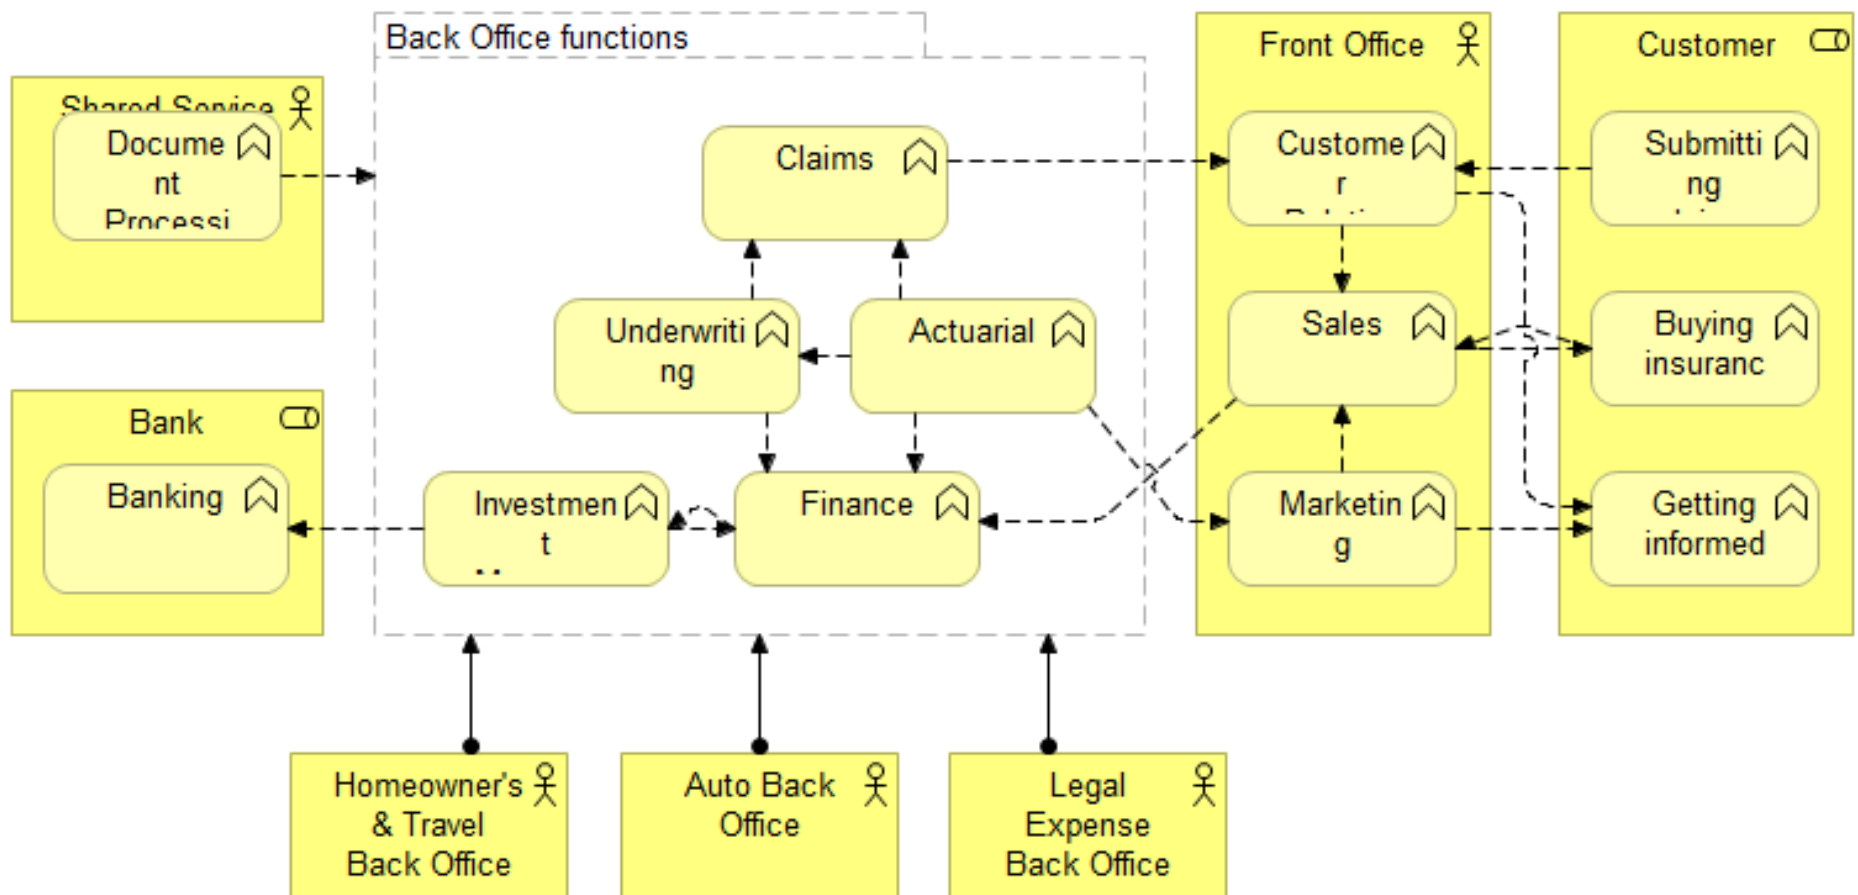

- Shows services offered by components to external entities and to each other

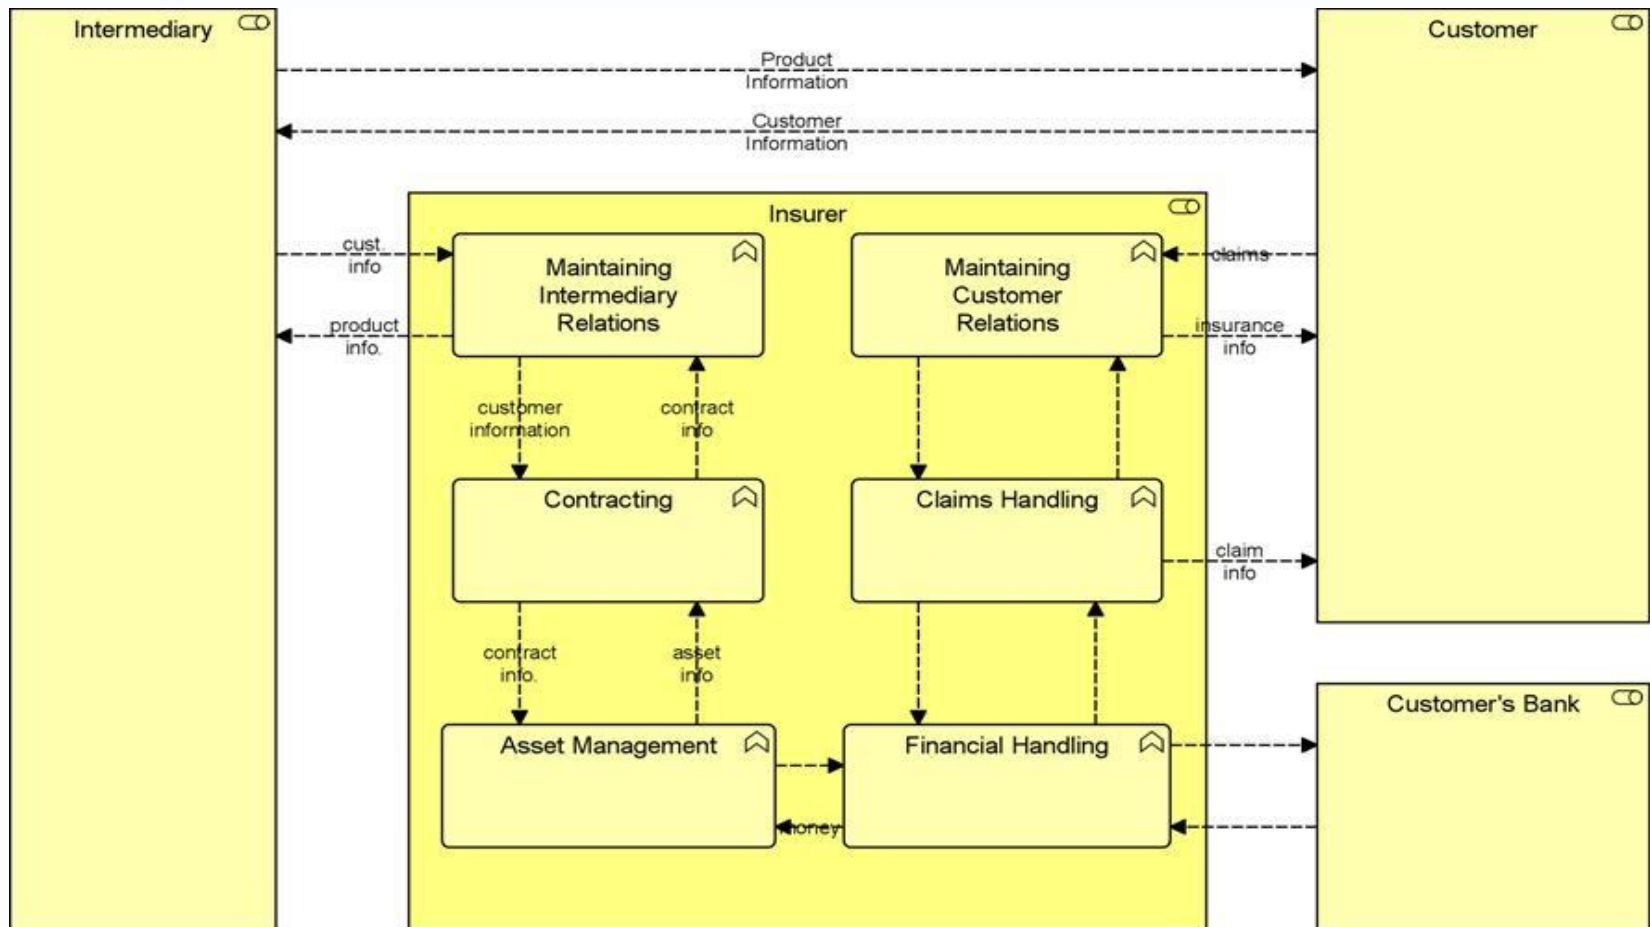

# Node Connectivity Diagram drawn using ArchiMate notation

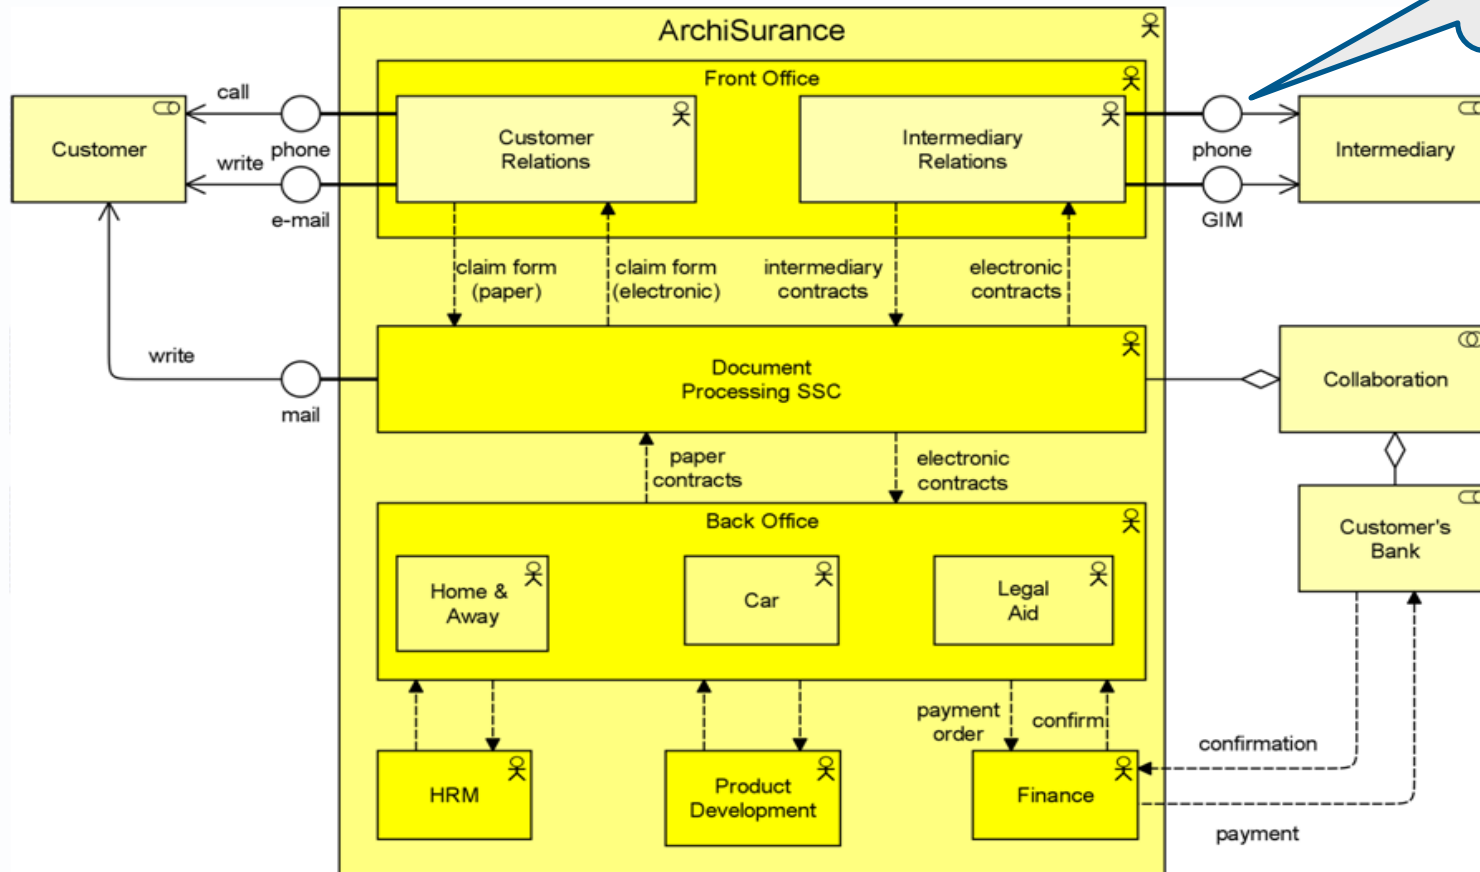

## ► Nodes are logical Functions

# Reasonable match in ArchiMate

## ► An Organization View - Nodes are physical Actors

Surely communication path rather than interface?

## TOGAF says: Actor/Role Matrix

- ▶ ... to show which actors perform which roles, supporting definition of security and skills requirements.
- ▶ Understanding Actor-to-Role relationships is a key supporting tool in definition of training needs, user security settings, and organizational change management.

Actor	Role	A	B	C
P		Performs	Performs	
Q			Performs	Performs

# Reasonable match in ArchiMate

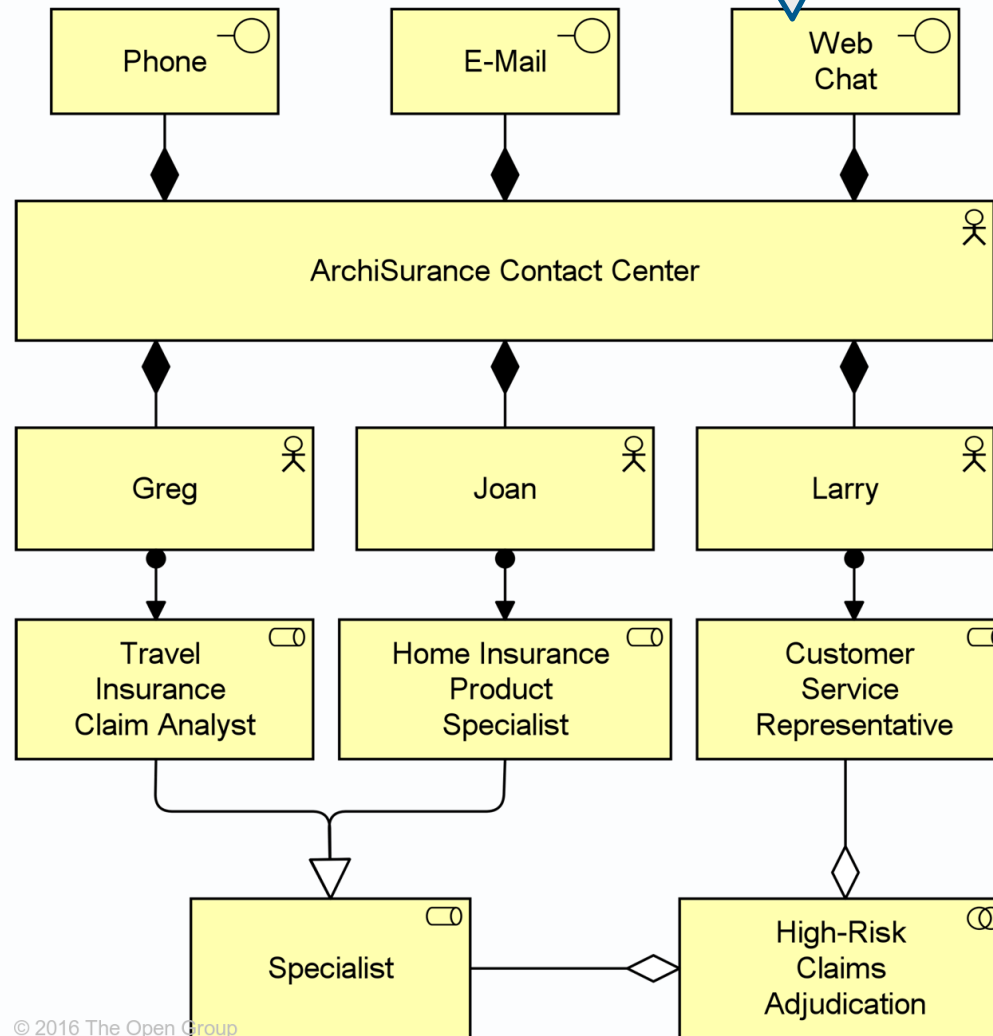

Surely  
communication path  
rather than  
interface?

Avancier

Organization unit

Actor

Role

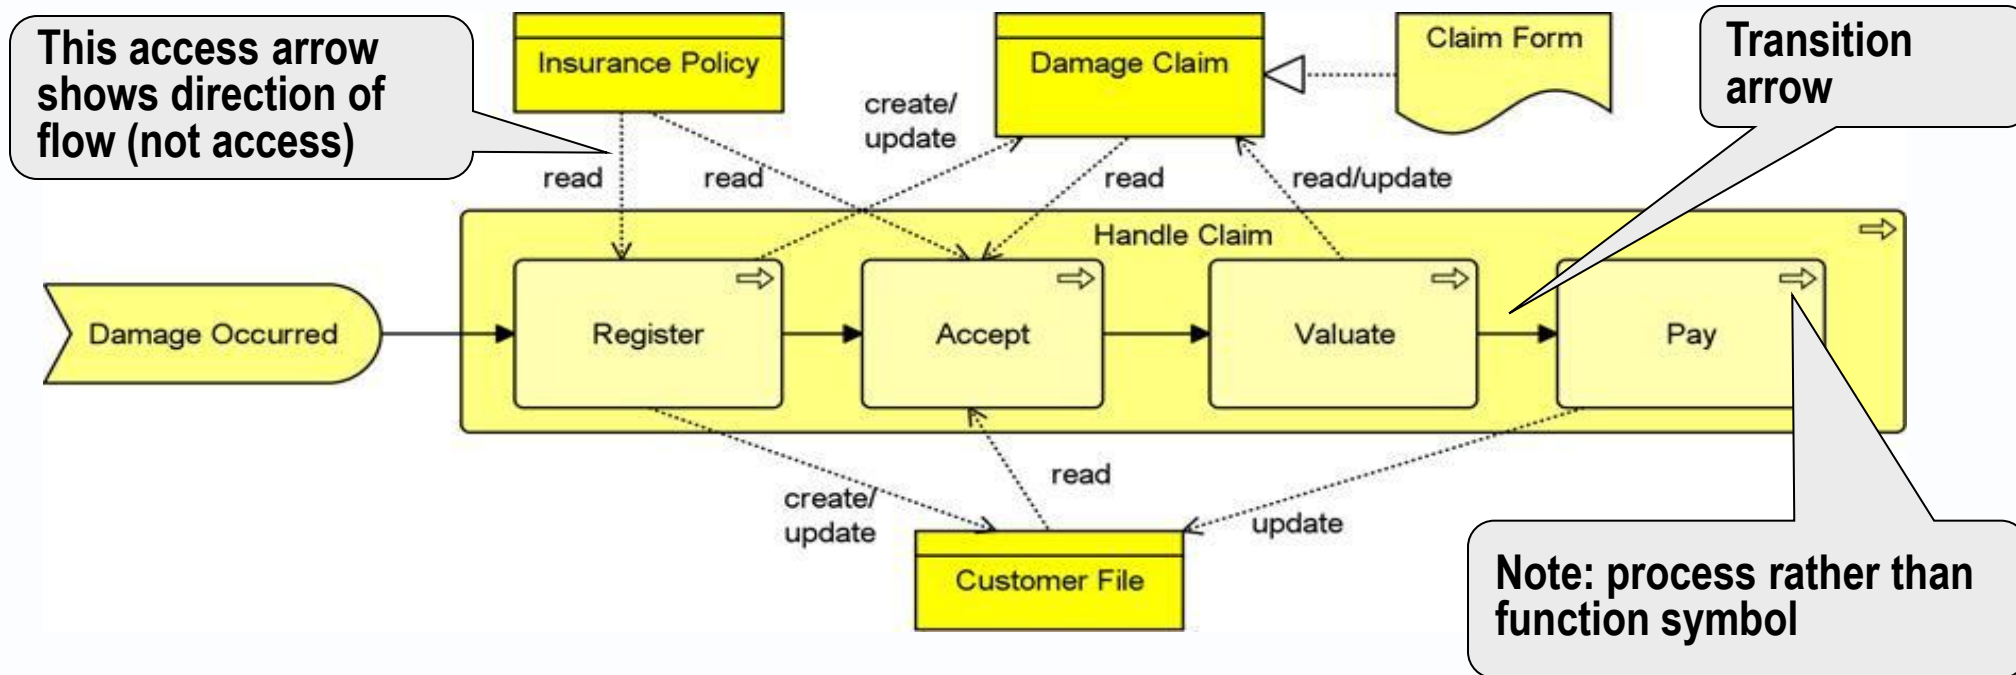

# TOGAF says: Business Service/Information Diagram

- ▶ ... shows the information needed to support one or more business services.
- ▶ ... shows what data is consumed by or produced by a business service and may also show the source of information.
- ▶ ... shows an initial representation of the information present within the architecture and therefore forms a basis for elaboration and refinement within Phase C (Data Architecture).

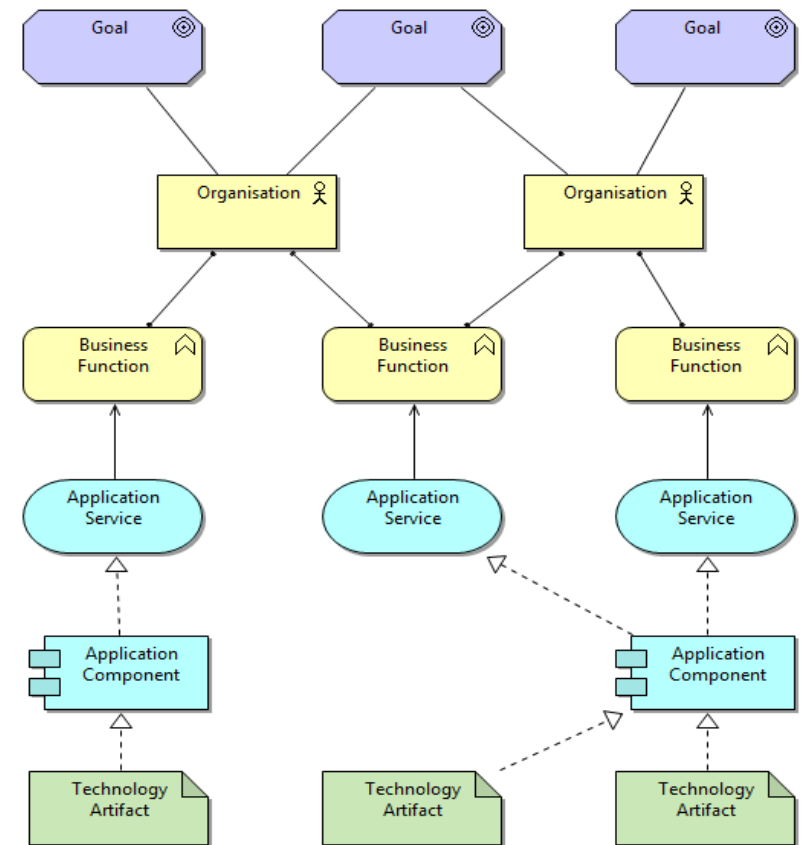

Information needed	Customer account	Sender address	Receiver address	Depot address	Package description	Package status	Journey route
Business services							
Order delivery	Use	Create	Create	Use	Create	Initialise	
Collect from sender		Use	Use	Use	Use	Update	Use
Deliver to depot					Use	Update	
Sort in depot			Use			Update	
Collect from depot						Update	Use
Deliver to receiver						Update	

- ▶ **A Business Process View**
- ▶ Maps to the process that delivers a service, rather than the service

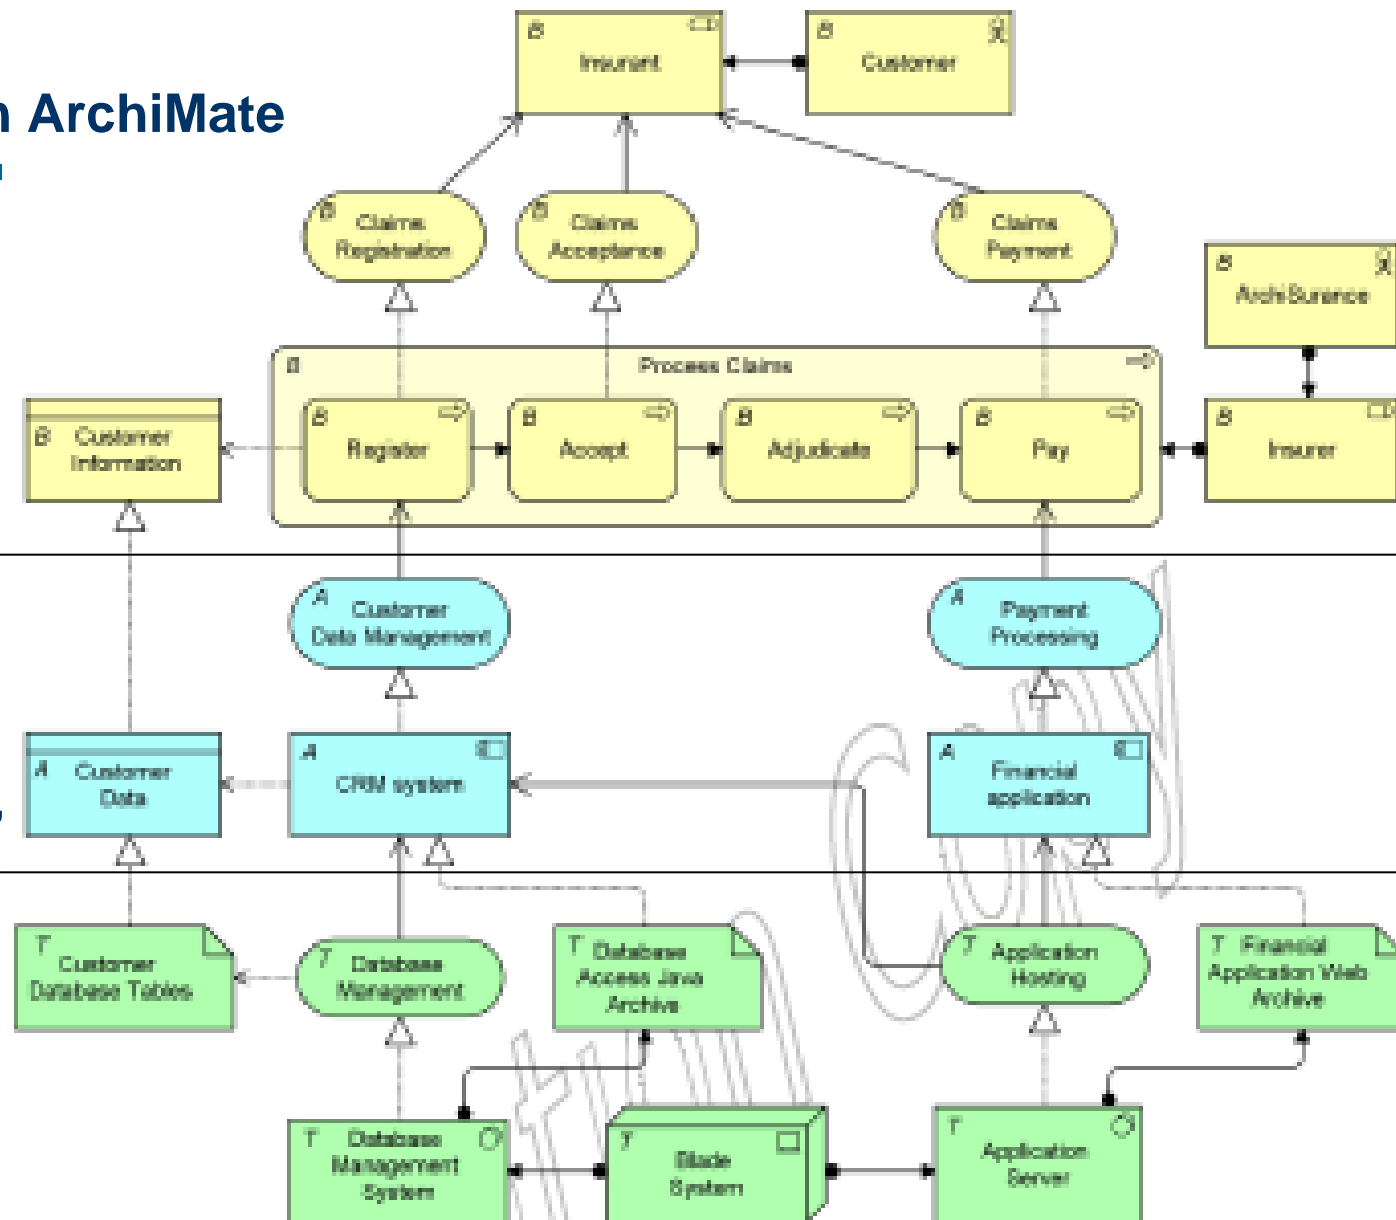

# TOGAF says: Business Footprint Diagram

- ▶ describes the links between business goals, organizational units, business functions, and services,
- ▶ maps these functions to the technical components delivering the required capability.
- ▶ provides a clear traceability between a technical component and the business goal that it satisfies
- ▶ demonstrates ownership of the services identified.
- ▶ demonstrates only the key facts linking organization unit functions to delivery services and is utilized as a communication platform for senior-level (CxO) stakeholders.

## Reasonable match in ArchiMate

- **Layered viewpoint**
- Layers and aspects of an EA in one diagram.
- Dedicated layers: technology, application, process, and actor/role layers
- Service layers: “serving” the next dedicated layer
- This example is not intended to be prescriptive.

Example 33: Cross-Layer Relationships

# Functional Decomposition diagram in BPMN style

- ▶ Top-level functions shown as “groups”
- ▶ Sub-functions shown as collapsed processes “pools”

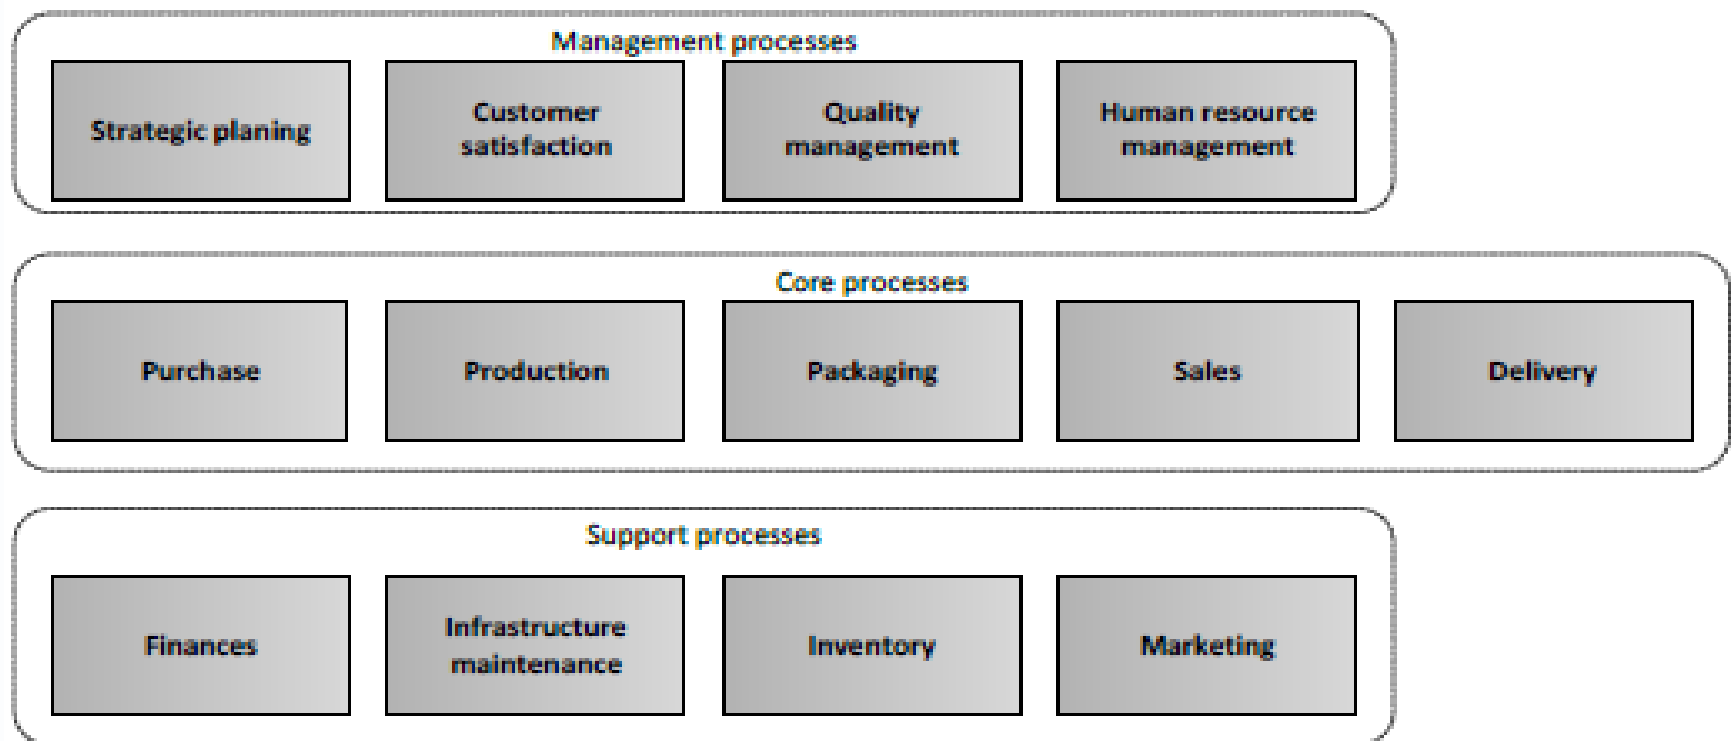

Figure 4: BPMN based "process landscape"

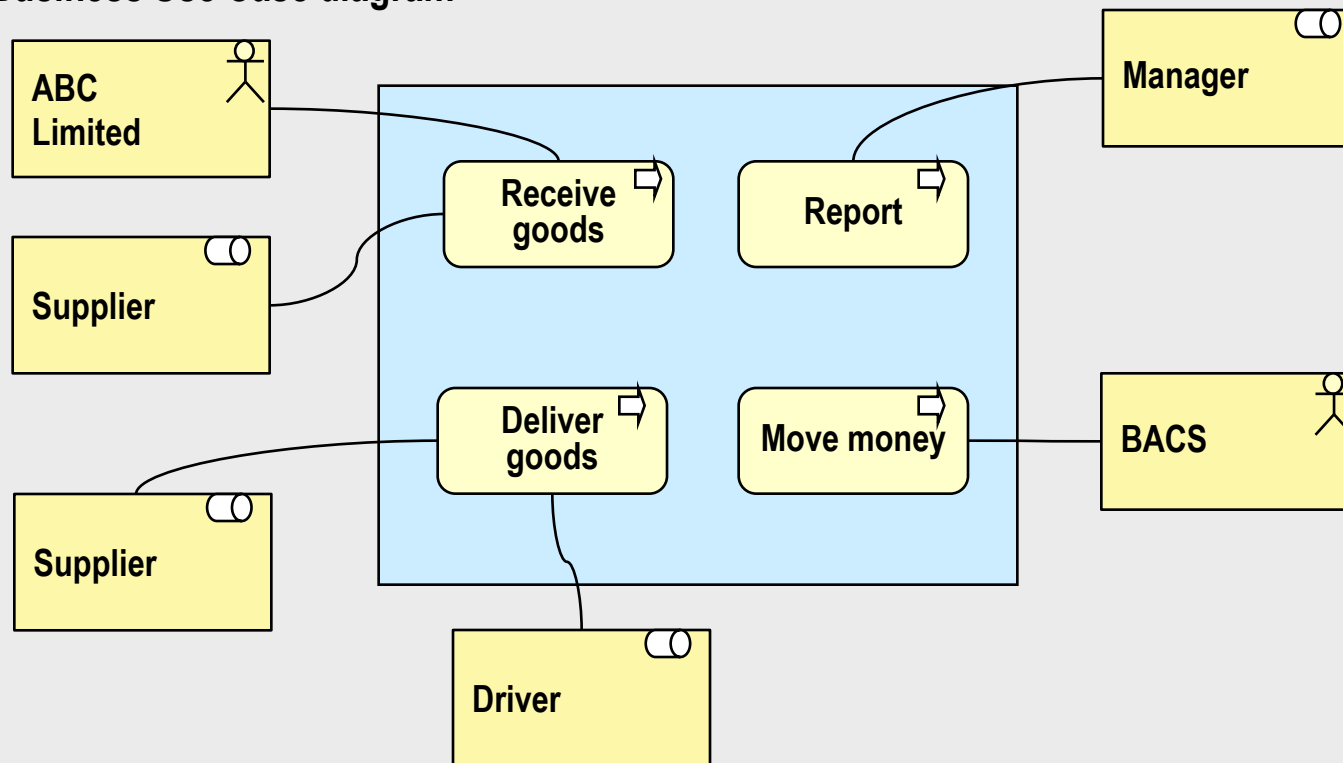

# TOGAF says: Business Use-Case diagram

- ▶ displays the relationships between consumers and providers of business services.
- ▶ Business services are consumed by actors or other business services
- ▶ The diagram provides added richness in describing business capability by illustrating how and when that capability is used.
- ▶ to help to describe and validate the interaction between actors and their roles to processes and functions.
- ▶ As architecture progresses, use-cases can evolve from the business level to include data, application, and technology details.
- ▶ Architectural business use-cases can also be re-used in systems design work.

# Business Use Case diagram: illustration

- ▶ What uses do external entities make of a business?
- ▶ What processes are executed in the scope of a business?

Business Use Case diagram

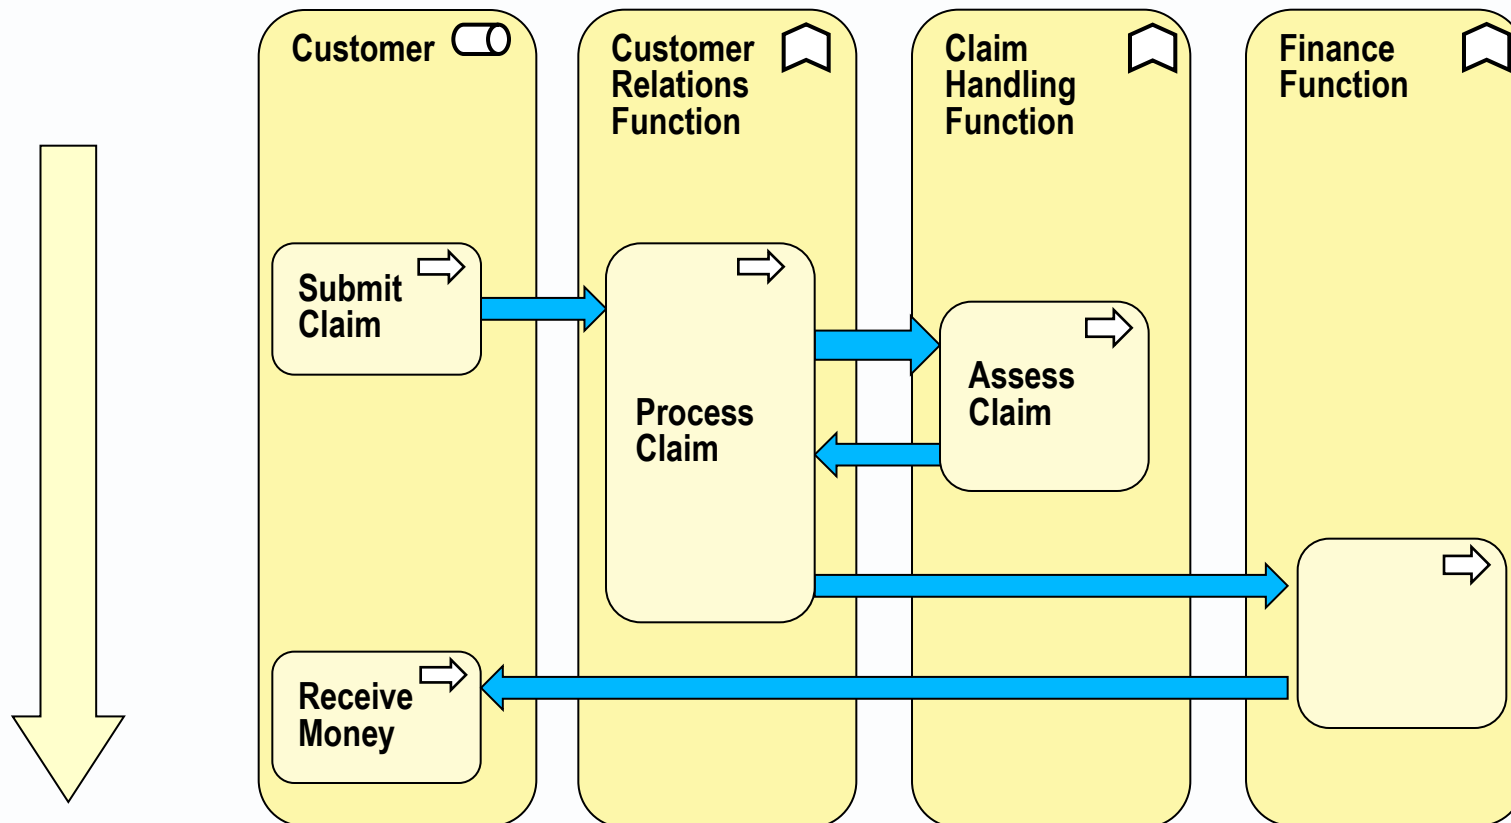

- ▶ To depict the relationship between events and process.
- ▶ Events [represent]
  - Arrival [capture] of information
    - (e.g., customer submits sales order)
  - Points in time
    - (e.g., end of fiscal quarter)
- ▶ Events cause work and actions need to be under taken within the business.
- ▶ Events are considered as triggers for a process.
- ▶ It is important to note that the event has to trigger a process and generate a business response or result.

## Event diagram dawn as sequence diagram

- Shows how each role of function may trigger a process carried out by another

- ▶ can list both roles and the activities expected of each role.
- ▶ A role is a group of *activities* that is performable by one or more actors, by virtue of the *abilities* required.

- ▶ UML, Actor = Roles
- ▶ TOGAF, Actor is an entity (an individual) that plays a Role
  - (though this is obscured in the text and the meta model).
- ▶ As you may realise
  - a Client is an individual, whereas “Client” is a type;
  - *an* Insurant is a Client
  - the “Insurant” role is a subtype of the “Client” role.
- ▶ ArchiMate appears to align with TOGAF, but some example ArchiMate diagrams suggest Actor is *a subtype* of Role. E.g.
  - “Client” is an Actor
  - “Insurant” is a Role.

# A Data entity / Business function matrix

- ▶ The North West corner method sorts the rows and columns of a matrix
- ▶ by clustering them on a shared cell entry, such as “create”.

		LOGICAL APPLICATION GROUPS		DATA CLASSES

KEY

C = creators of data U = users of data

# TOGAF says: Information Exchange matrix

- ▶ identifies who exchanges what information with whom, why the information is necessary, and in what manner.
- ▶ It documents the information exchange requirements between three basic entities (activities, business nodes and their elements, and information flow).
- ▶ It focus on characteristics of the information exchange, such as performance and security.

- ▶ to assist in understanding the lifecycles of key entities within the enterprise.
- ▶ Understanding product lifecycles is becoming increasingly important with respect to environmental concerns, legislation, and regulation where products must be tracked from manufacture to disposal.
- ▶ Equally, organizations that create products that involve personal or sensitive information must have a detailed understanding of the product lifecycle in order to ensure rigor in design of controls, processes, and procedures.
- ▶ **Examples include credit cards, debit cards, store/loyalty cards, smart cards, user identity credentials (identity cards, passports, etc.).**

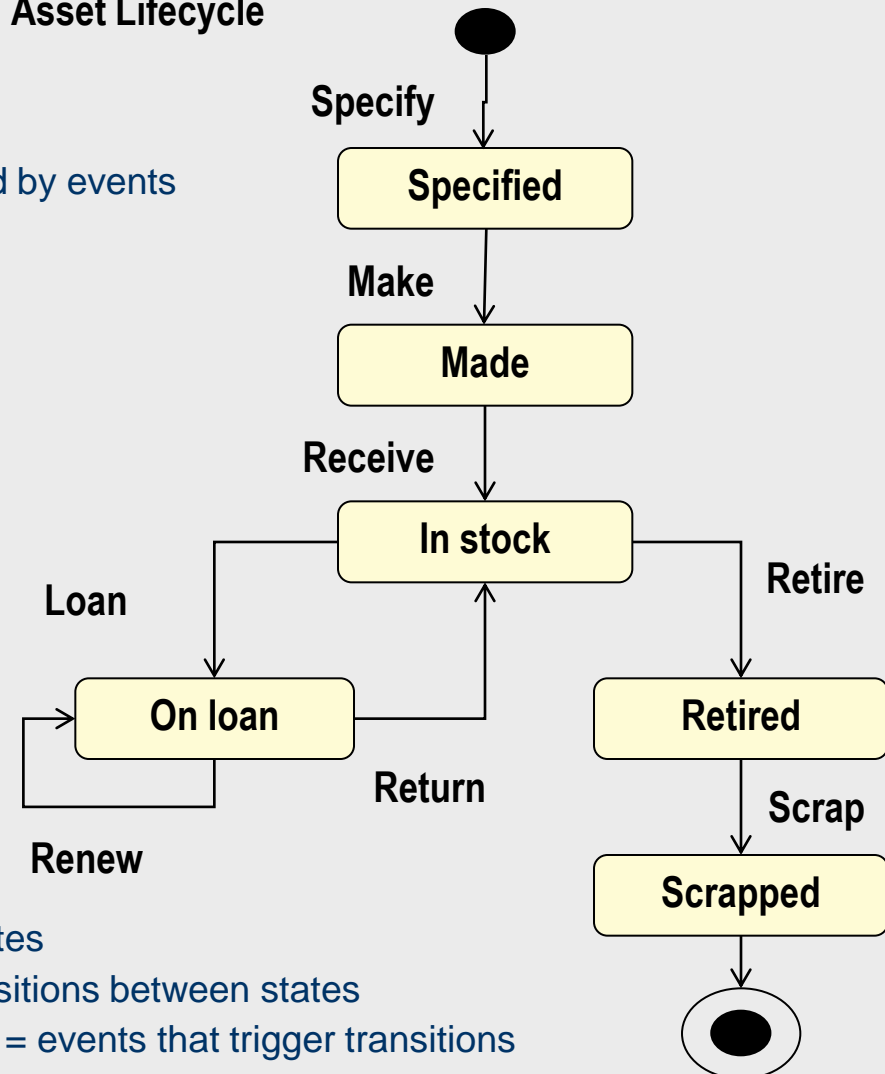

# Product Lifecycle diagram: illustration

- ▶ What states does a product move through?
- ▶ What events trigger each state transition?
- ▶ Useful in product lifecycle management.
- ▶ A lifecycle views an entity as a long-term process, updated by events

## UML State Chart

## Asset Lifecycle

Boxes = states

Lines = transitions between states

Annotations = events that trigger transitions

# Business process map diagram

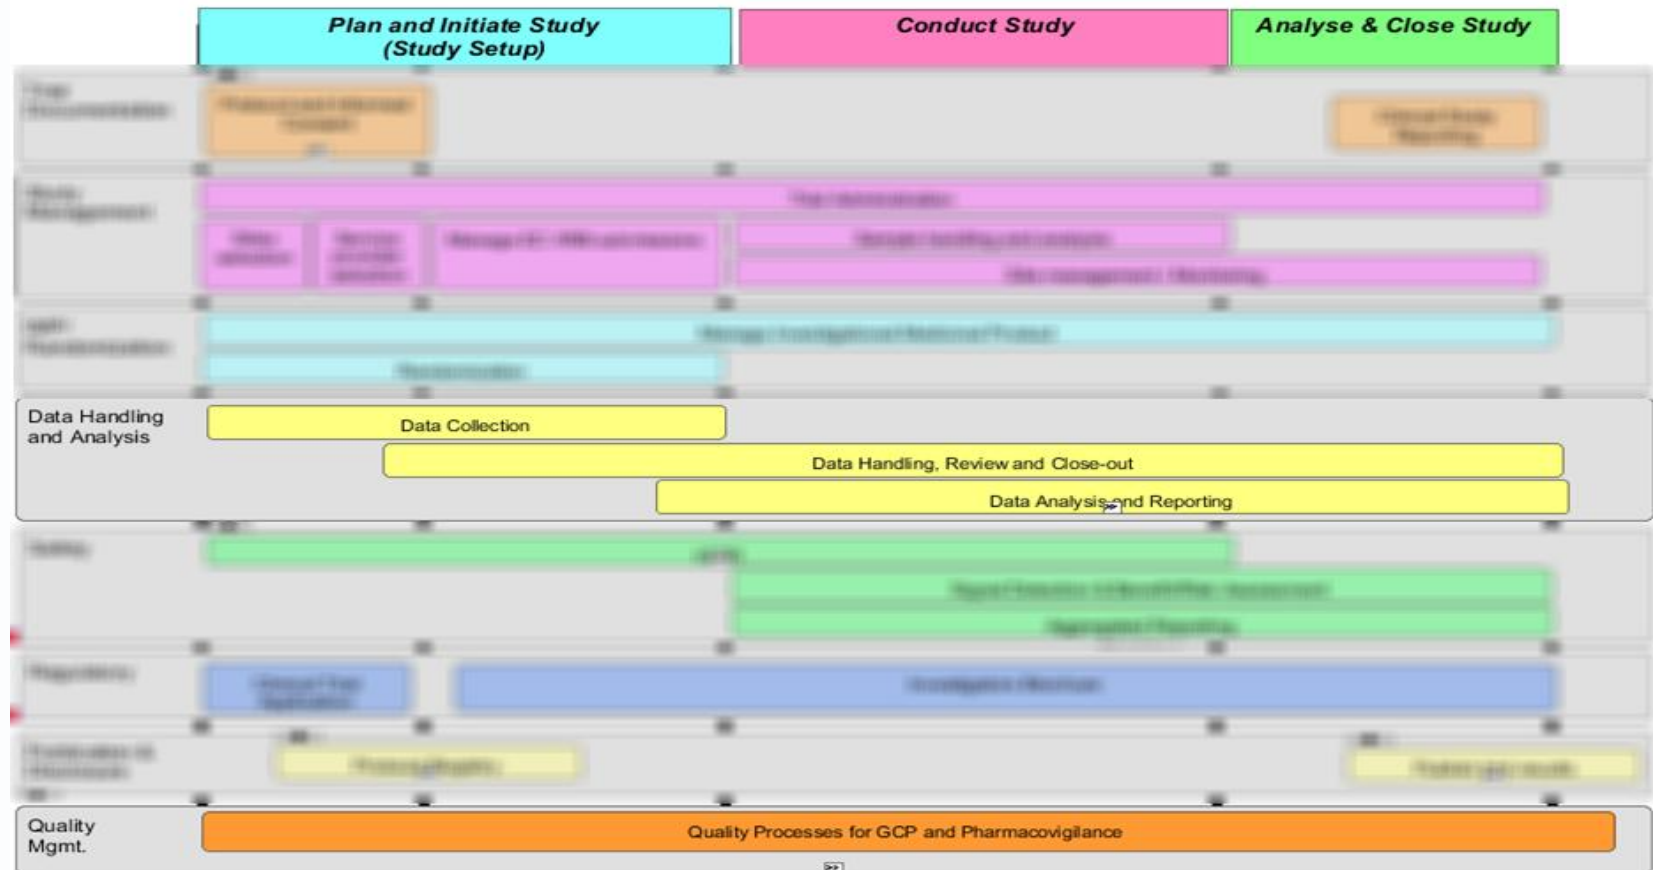

- ▶ What processes are carried out in an enterprise or system?
- ▶ A summary and ideally engaging graphical representation.

TMF: eTOM

# Business process map diagram

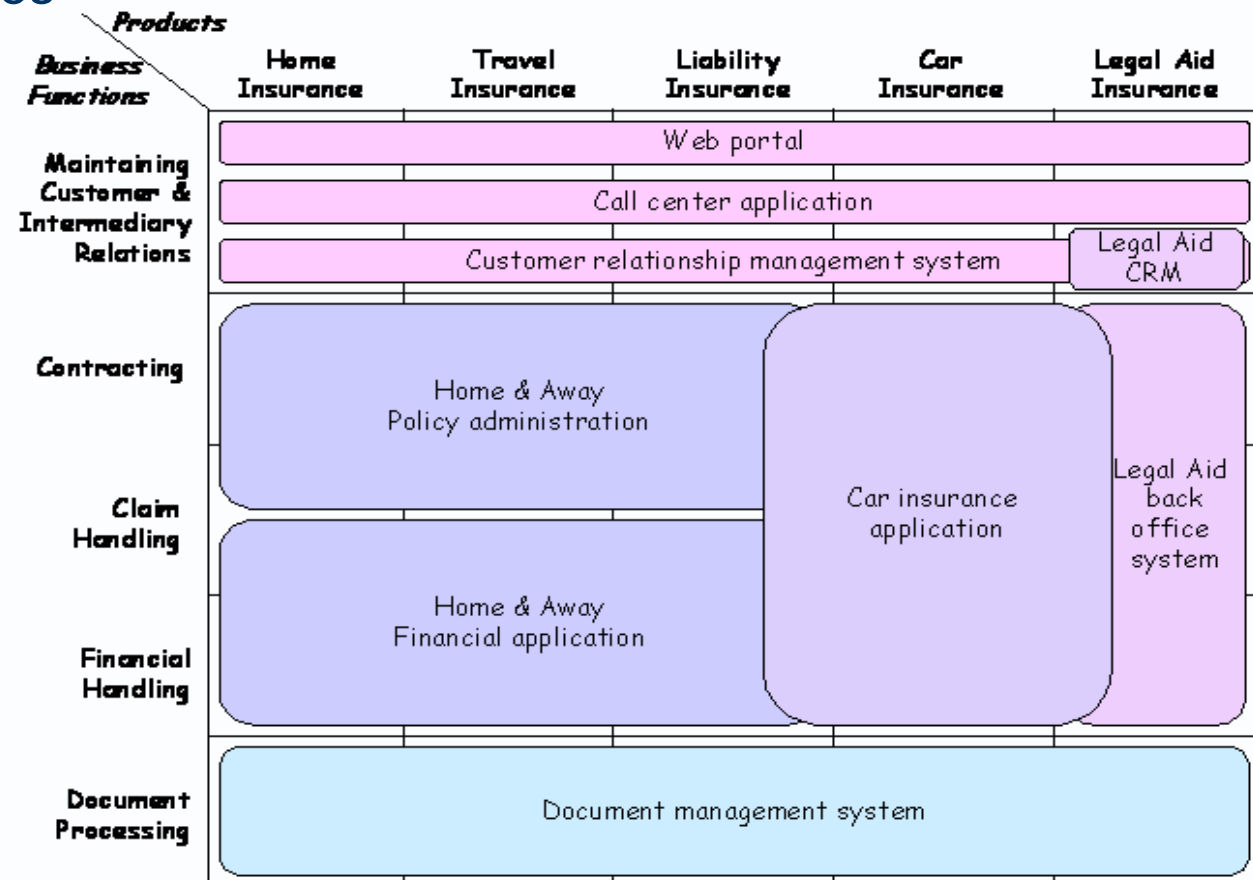

- ▶ What processes are carried out in an enterprise or system?
- ▶ A summary and ideally engaging graphical representation.

# ArchiMate 2.1: Landscape Map Viewpoint

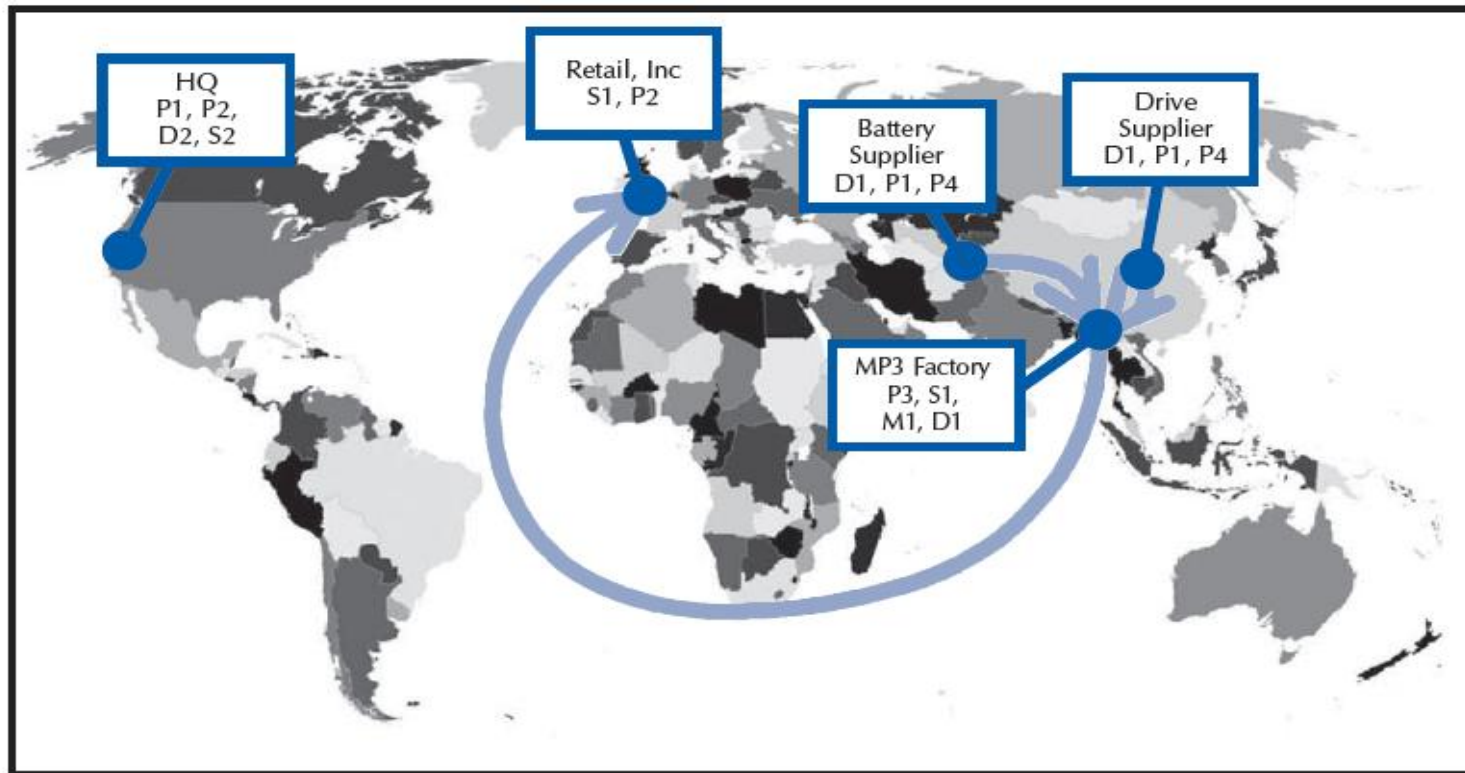

Cf. Business process map

- ▶ Stakeholders: Enterprise architects, top managers: CEO, CIO
- ▶ Concerns: Readability, management and reduction of complexity, comparison of alternatives

## Location map diagram

- ▶ Where are business activities carried out?
- ▶ Where are business resources to be found?

- ▶ From Supply Chain Council web site

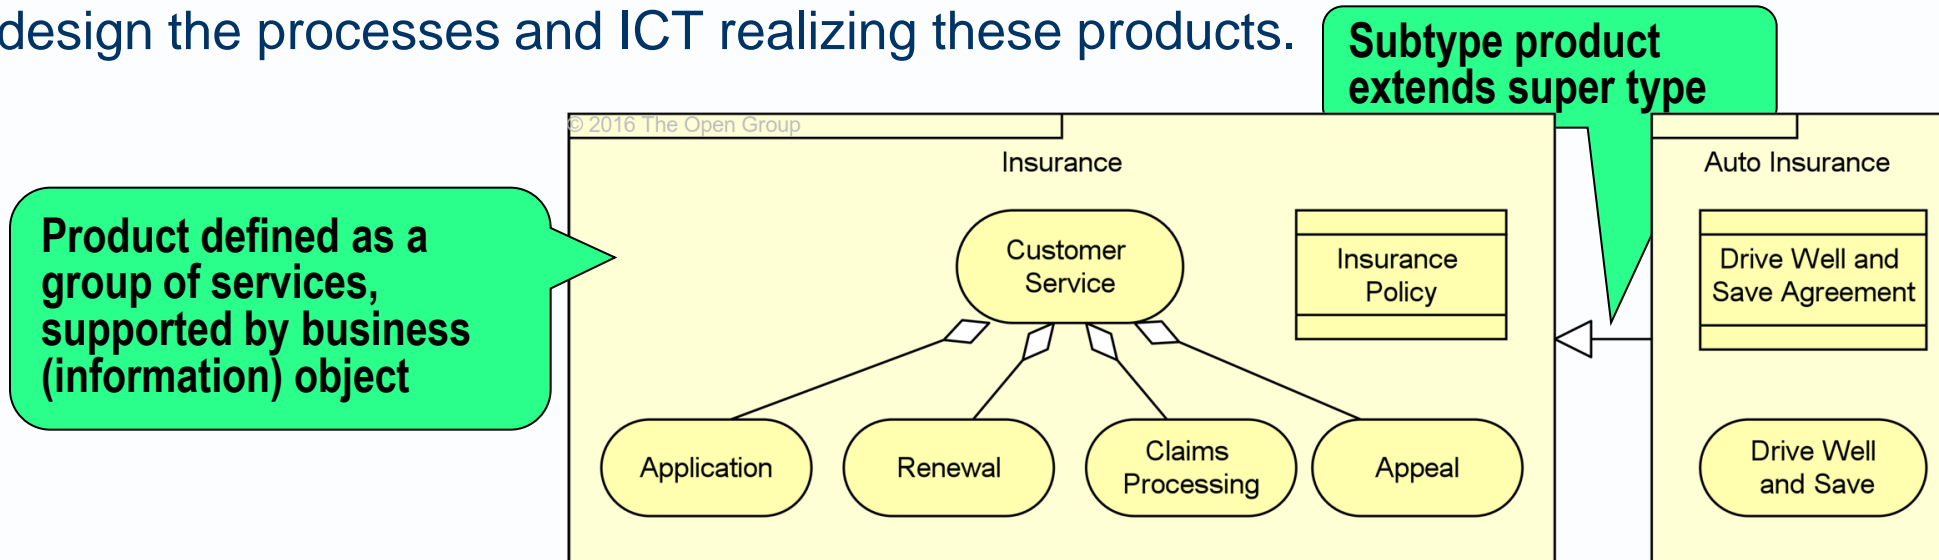

# Location communication path diagram: an illustration

- ▶ What are the routes via which nodes can be connected and communicate?
  - solid lines - how locations may inter-connect
  - solid arrows - the different ways a customer might use the service
  - a dotted line – a possible future communication path

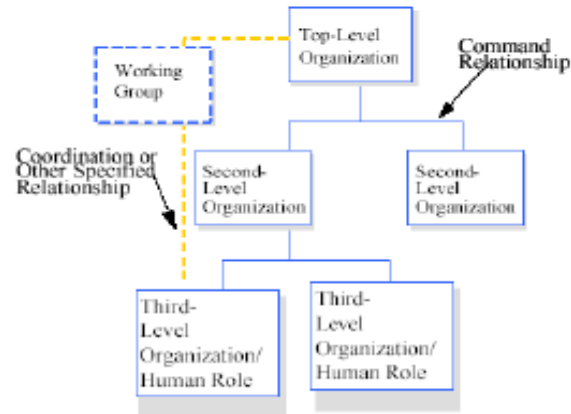

# ArchiMate 3.0 Product Viewpoint

- ▶ depicts the value products offer to the customers or other external parties and shows the composition of one or more products in terms of the constituting services, and the associated contract(s) or other agreements.
- ▶ may also be used to show the interfaces (channels) through which this product is offered, and the events associated with the product.
- ▶ typically used to design a product by composing existing services or by identifying which new services have to be created for this product,
- ▶ may then serve as input for business process architects and others that need to design the processes and ICT realizing these products.

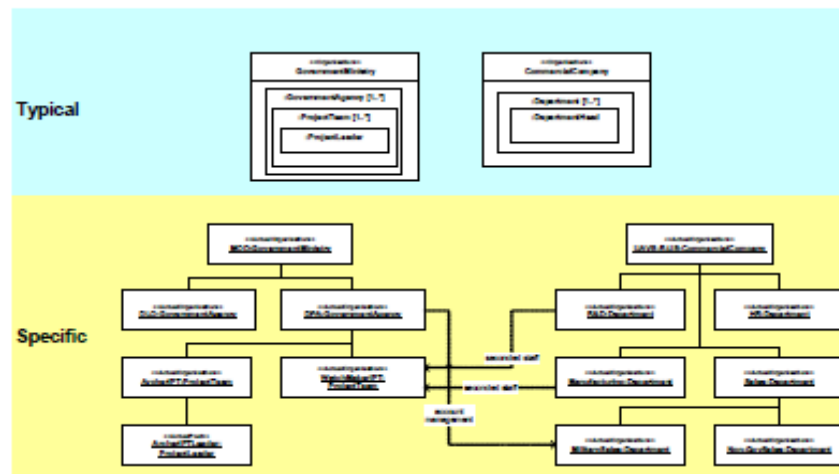

# Organisational relationships chart: MODAF style

## OV-4 Organisational Relationships Chart

Example – Generic Organisational Template

Example – UML version of OV-4

**Data objects:**  
Organisations  
Resources

**Usage:**  
Operational analysis  
Organisation optimisation
